Target Exchange 2007 Environment Preparation

Follow the steps that are described in the Preparation Checklist topic to prepare your Exchange 2007 organization and its environment for being the target organization in the Exchange migration process conducted by Migration Manager for Exchange.

On some of steps you may need to coordinate the setup process with the administrator of the source Exchange organization.

Preparation Overview

This section provides a short overview of the main steps that should be performed to set up your target Exchange 2007 organization and its environment for migration using Migration Manager for Exchange. These steps are described in detail below.

Setting up the target Exchange 2007 organization consists of four main steps:

Checking the System Requirements

On this step make sure that your environment meets the minimal system requirements for Migration Manager for Exchange agents. For more details, see Checking System Requirements.

Setting Up Accounts and Required Permissions

On this step you should set up the accounts and required permissions for Exchange migration. There are four main types of accounts used by Migration Manager for Exchange agents:

- Target Active Directory Synchronization Account This account is used by:
 - a. The Directory Synchronization Agent (DSA) to access the target Active Directory domain
 - b. The Mail Source Agent (MSA) to perform mailbox switch
- Target Exchange Account
 This account is used by Migration Manager for Exchange agents installed on agent host to access the target Exchange server.
- Target Active Directory Account
 This account is used by Migration Manager for Exchange agents to access the target domain.
- Target Agent Host Account
 This account is used to install and run the Migration Manager for Exchange agents on agent host and to access the license server.

You can simplify the setup by using a single account for all Migration Manager for Exchange processes. This account should have the permissions that are required for Migration Manager for Exchange console and all agents on every server that is involved in the migration.

For more details, see Setting Up Accounts and Required Permissions.

Preparing the Target Exchange Environment for Exchange Migration

On this step you should perform common environment preparations:

- · Back up Exchange.
- Create the Aelita EMW Recycle Bin public folder (optional).
- Create administrator mailboxes for public folder and free/busy synchronization.
- · Create administrator mailboxes for mailbox and calendar synchronization (optional).
- Install Microsoft Exchange Server MAPI Client and Collaboration Data Objects 1.2.1 version 6.5.8353.0 or later.
- Specify the displayName value for target Exchange 2007 mailbox database objects.

For more details, see Preparing the Target Exchange Environment for Exchange Migration.

Setting Up Connection with the Source Exchange Organization Using SMTP Connectors

On this fourth step you should set up the connection with the source Exchange organization using SMTP connectors. This task consists of three subtasks given below:

- Setting up the target Exchange 2007 organization for Internet mail flow between target and source Exchange organizations
- 2. Configuring target DNS server for mail forwarding
- 3. Testing the SMTP connectors (optional)

For more details, see Setting Up Connection with the Source Exchange Organization Using SMTP Connectors.

Preparation Checklist

This checklist will help you set up your target Exchange 2007 organization and its environment properly. Make sure you have done all the steps below before completing the preparation.

Check Step

Check the system requirements
Set up the Target Active Directory Synchronization Account
Set up the Target Exchange Account
Set up the Target Active Directory Account
Set up the Target Agent Host Account
Back up Exchange
Create the Aelita EMW Recycle Bin public folder (optional)
Create administrator mailboxes for public folder and free/busy synchronization
Create administrator mailboxes for mailbox and calendar synchronization (optional)
Install Microsoft Exchange Server MAPI Client and Collaboration Data Objects 1.2.1 version 6.5.8353.0 or later

Check Step

Specify displayName value for target Exchange 2007 mailbox database objects
Configure the NSPI connection limit
Set up the target Exchange organization for Internet mail flow between target and source Exchange organizations
Configure the target DNS server for mail forwarding
Test the SMTP connectors (optional)

Prerequisites

Before starting the preparation of the target Exchange 2007 organization and its environment, make sure that you have the privileges to grant all of the following permissions to accounts.

NOTE: The list of permissions given below contains all required permissions for the accounts. However some of the permissions can be replaced with their equivalents. For more information, see the corresponding steps for each account.

Target Active Directory Synchronization Account

. Membership in the Administrators or Domain Admins group of the target domain.

Target Exchange Account

- · Read access to the target domain.
- Membership in the local Administrators group on all target Exchange servers involved in the migration.
 If a server is a domain controller, the account should be added to the domain local Administrators group of the domain.
- Full Control permission on the organizational units (OUs) (and their child objects) where the target synchronized objects are located.
- Full Control permission on target Exchange 2007 servers (including Send As and Receive As permissions).
- **Full Control** permission on the Microsoft Exchange System Objects organizational unit in all domains in which target Exchange 2007 servers involved in public folder synchronization reside.
- Exchange Public Folder Administrator role.

Target Active Directory Account

- Read access to the target domain.
- Full Control permission on the organizational units (OUs) (and their child objects) where the target synchronized objects are located.
- Read permission for the Microsoft Exchange container in the target Active Directory.

Target Agent Host Account

- Membership in the local Administrators group on the license server (unless alternative credentials are
 used for the license server). If server is located in another trusted forest, the account should have local
 Administrator permissions on the license server.
- Local Administrator permissions on the agent host server.

Checking System Requirements

CAUTION: Any computer that does not meet the requirements should be upgraded before installing Migration Manager for Exchange components.

Migration Manager for Exchange uses the following Exchange-specific agents involved in the migration process:

- · Public Folder Source Agent
- · Public Folder Target Agent
- Mail Target Agent
- · Calendar Synchronization Agent
- · Free/Busy Synchronization Agent
- · Transmission Agent
- Migration Agent for Exchange

Agents work on agent host servers.

Agent host can be:

- 1. An Exchange server itself, which is the default configuration. After you enumerate an Exchange organization all Exchange servers are registered as agent hosts for themselves.
- 2. Another Exchange server from the same Exchange organization.
- 3. A stand-alone server. It can be located in another forest or workgroup.

For detailed information about system requirements for agent hosts, see the Exchange Migration Agents section of the System Requirements and Access Rights.

Target Exchange 2007 Organization Considerations

- The mailbox database containing the administrator mailbox (the System Attendant mailbox used by default or custom administrator mailbox) should be mounted for each target Exchange 2007 server involved in the migration..
- The Migration Manager for Exchange console shows only those servers from target Exchange 2007
 organization that host the Mailbox role. This is required because only servers with actual data are
 considered for migration.
- Public folder stores are no longer mandatory for Exchange 2007 organizations. However, some
 restrictions may apply if Exchange 2007 organization does not have public folder store. For more
 information about these restrictions, see Exchange 2003 to Exchange 2007 Migration Restrictions.

Setting Up Accounts and Required Permissions

This section describes requirements for accounts working with the target Exchange servers. Migration Manager for Exchange allows you to use different administrative accounts for different purposes. Exchange data is migrated by Migration Manager for Exchange agents, which use the following accounts:

- Target Active Directory Synchronization Account This account is used by:
 - a. The Directory Synchronization Agent (DSA) to access the target Active Directory domain
 - b. The Mail Source Agent (MSA) to perform mailbox switch
 For more details, see Setting Up the Target Active Directory Synchronization Account.
- Target Exchange Account

access the license server.

This account is used by Migration Manager for Exchange agents installed on agent host to access the target Exchange server.

For more details, see Setting Up the Target Exchange Account.

- Target Active Directory Account
 This account is used by Migration Manager for Exchange agents to access the target domain.

 For more details, see Setting Up the Target Active Directory Account.
- Target Agent Host Account
 This account is used to install and run the Migration Manager for Exchange agents on agent host and to

For more details, see Setting Up the Agent Host Account.

Setting Up the Target Active Directory Synchronization Account

This section describes how to set the required permissions for the Target Active Directory Synchronization Account. This account is used by:

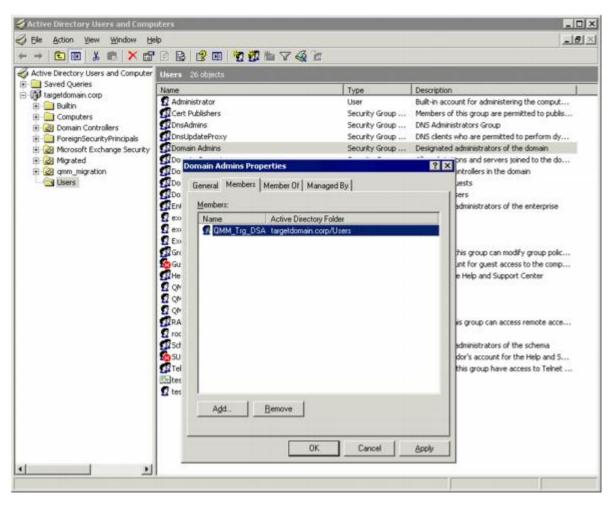

- . The Directory Synchronization Agent (DSA) to access the target Active Directory domain
- . The Mail Source Agent (MSA) to perform mailbox switch

The required privilege level for the Target Active Directory Synchronization Account is membership in the **Domain Admins** group of the target domain.

CAUTION: If for some reason you cannot grant such privileges to the Target Active Directory Synchronization Account, and then refer to the System Requirements and Access Rights document for the list of minimal required permissions.

To grant the necessary permission to the Target Active Directory Synchronization Account, perform the following:

- 1. On the target domain controller in the **Active Directory Users and Computers** snap-in, click **Users**, then in the right pane right-click **Domain Admins** and click **Properties**.
- Go to the Members tab, click Add and select the Target Active Directory Synchronization Account (in our example, QMM_Trg_DSA).

3. Close the dialog boxes by clicking OK.

Setting Up the Target Exchange Account

This section describes how to set the required permissions for the Target Exchange Account used by Migration Manager for Exchange agents. This account is used for the following:

- Working with target Exchange mailboxes and public folders (used by the Mail Target Agent, Public Folder Source Agent, and Public Folder Target Agent)
- Making the newly-created public folders mail-enabled (the folders are used by the public folder agents only: Public Folder Source Agent and Public Folder Target Agent)
- · Synchronizing Calendar information (used by the Calendar Synchronization Agent)
- Synchronizing free/busy data (optional) (used by the Free/Busy Synchronization Agent)
- Moving mailboxes

The required privileges for the Target Exchange Account are as follows:

- · Read access to the target domain.
- Membership in the local Administrators group on all target Exchange servers involved in the migration.
 If a server is a domain controller, the account should be added to the domain local Administrators group of the domain.
- Full Control permission on the organizational units (OUs) (and their child objects) where the target synchronized objects are located.
- Full Control permission on target Exchange 2007 servers (including Send As and Receive As permissions).
- **Full Control** permission on the Microsoft Exchange System Objects organizational unit in all domains in which target Exchange 2007 servers involved in public folder synchronization reside.
- Exchange Public Folder Administrator role.

As a result the Target Exchange Account should be able to log on to each mailbox on this target server. To set up the Target Exchange Account, perform the steps described in the related subtopics.

NOTE: Note that the steps are given only as an example of a possible Target Exchange Account setup.

Changing Default Exchange Account

The default Exchange Account (initially displayed on the **Connection** page of the Exchange server **Properties**) is set when you add the source or target organization to the migration project (see the *Registering Source and Target Organizations* section of the *Migration Manager for Exchange User Guide* for details). If necessary, you can change the default Exchange Account by clicking **Modify** on the **General | Connection** page in the properties of the corresponding server in the Migration Manager for Exchange Console.

Mailbox and calendar synchronization

The default Exchange Account for mailbox and calendar synchronization is specified when you create a corresponding synchronization job. To change it, use properties of the corresponding mailbox or calendar synchronization job.

Public folder synchronization

The default Exchange Account for public folder synchronization (initially displayed on the **Connection** page of the Exchange server **Properties**) is set when you add the source or target organization to the migration project (see the *Registering Source and Target Organizations* section of the *Migration Manager for Exchange User Guide* for details). If necessary, you can change the default Exchange Account for public folder synchronization by clicking **Modify** on the **General | Connection** page in the properties of the corresponding server in the Migration Manager for Exchange Console.

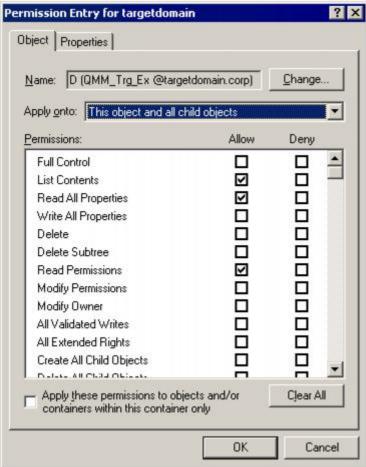

To go on using the default Exchange Account for Exchange migration, grant the permissions required for Exchange migration to this account (see the next steps).

Granting Read Access to the Active Directory Domain

Target Exchange Account should have **Read** access to the target Active Directory.

To grant this permission to the Target Exchange Account, complete the following steps:

- 1. In the **Active Directory Users and Computers** snap-in, right-click the domain name (in our example, targetdomain), and then click **Properties**.
- 2. On the Security tab, click Add and select the Target Exchange Account (in our example, QMM_Trg_Ex).
- Select the Target Exchange Account, and then check the Allow box for the Read permission in the Permissions box.
- 4. Click the **Advanced** button. In the **Advanced Security Settings** dialog box, select the account you specified on step 2, and click **Edit**.
- 5. In the **Permission Entry** dialog box, select **This object and all child (descendant) objects** from the **Apply onto** drop-down list.

6. Close the dialog boxes by clicking OK.

Granting Membership in Server Local Administrators Group

The Target Exchange Account used by Migration Manager for Exchange agents should be a member of the local **Administrators** group on each target Exchange server involved in the migration.

CAUTION: If the Exchange server is a domain controller, the account should be added to the domain local Administrators group of the domain.

To add the Target Exchange Account to the local Administrators group on each target Exchange server involved in the migration, perform the following:

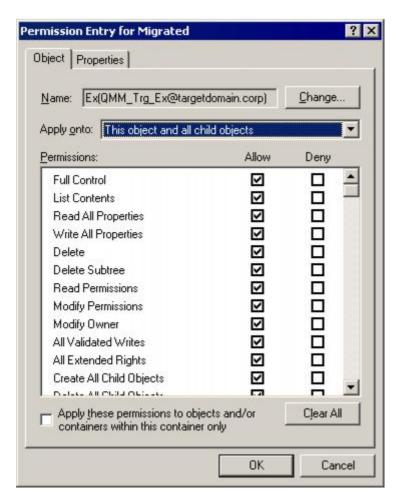

- 1. Open the Computer Management snap-in (Click Start | Run, enter compmgmt.msc and then click OK).
- 2. In the left pane click System Tools | Local Users and Groups | Groups.
- 3. Right-click the Administrators group and click Add to Group.
- 4. Click Add and select the Target Exchange Account (in our example, QMM_Trg_Ex).
- 5. Close the dialog boxes by clicking OK.

Granting Full Control on Organizational Unit

To work with the target Active Directory objects, the Target Exchange Account needs the Full Control permission on the organizational units and their child objects that contain the objects to be synchronized. This permission should be set on the domain controller where the objects you need to synchronize are located.

To grant the required permissions to the account, perform the following steps:

- 1. In the **Active Directory Users and Computers** snap-in, right-click the OU where the objects are located, and click **Properties**.
- 2. On the Security tab, click Add, and select the Target Exchange Account (in our example, QMM_Trg_Ex).
 - NOTE: If there is no Security tab, you should select View | Advanced Features in the Active Directory Users and Computers snap-in.
- Select the account name, and then enable the Allow option for the Full Control permission in the Permissions box.

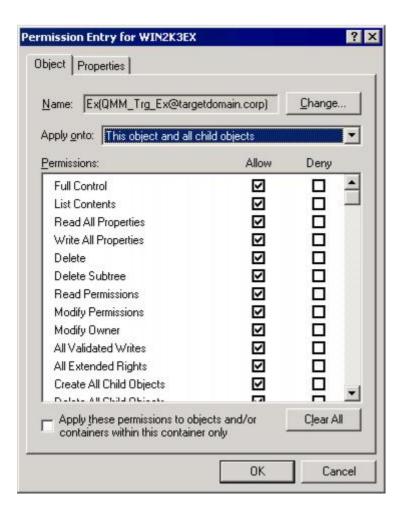

- 4. Click the **Advanced** button. In the **Advanced Security Settings** dialog box, select the account you specified on step 2, and click **Edit**.
- 5. In the **Permission Entry** dialog box, select **This object and all child (descendant) objects** from the **Apply onto** drop-down list.
- 6. Close the dialog boxes by clicking OK.

Granting Full Control on Exchange Servers

The Target Exchange Account should have the **Full Control** permission on Exchange servers in the target Exchange 2007 organization, including the **Send As** and **Receive As** permissions.

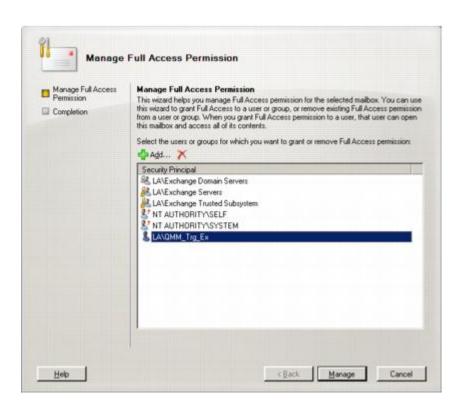

To grant the required permissions to the account, do the following:

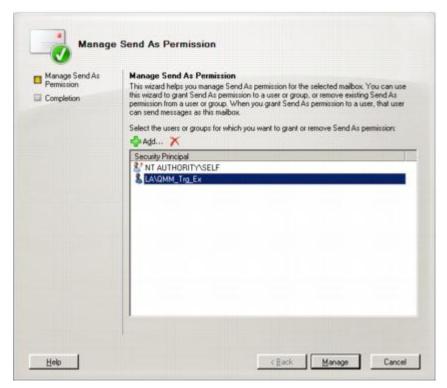

- 1. From the Start menu, select Run. In the Run dialog box, type ADSIEdit.msc. Click OK.
 - NOTE: If you have a Windows 2003 domain controller, then the ADSIEdit utility, which is part of the Windows 2003 Support Tools, may not be installed. In this case install the Support Tools by running the Support\Tools\Suptools.msi file located on the Windows 2003 CD.
- In the ADSIEdit snap-in, open the CN=Servers,CN=Exchange Administrative Group (FYDIBOHF23SPDLT),CN=Administrative Groups,CN=<ExchangeOrganizationName>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<...>,DC=<...> container.
- 3. For each Exchange server in this container that is involved in migration, complete the following steps:
- a. Right-click the server object and select Properties.
- b. In the Properties dialog box, click the Security tab.
- c. On the Security tab, click Advanced.
- d. In the Advanced Security Settings dialog box, click Add.
- e. In the **Select User**, **Computer**, or **Group** (or similar) dialog box, select the administrative account (in our example, **QMM_Trg_Ex**) and click **OK**.
- f. In the **Permission Entry** for dialog box, select **This object and all child (descendant) objects** from the **Apply onto** drop-down list.
- g. Allow Full Control permission for the administrative account, including the Send As and Receive As permissions.

h. Close the dialog boxes by clicking **OK**.

To make sure the above actions were performed correctly, please view the **Manage Full Access** and **Manage Send As** dialogs in Exchange Management console. You should see the Target Exchange Account in both of the dialogs below.

Granting Full Control on the Microsoft Exchange System Objects Organizational Unit

The Target Exchange Account used by Migration Manager for Exchange agents needs the Full Control permission on the Microsoft Exchange System Objects organizational unit (OU) in all domains in which target Exchange 2007 servers involved in public folder synchronization reside.

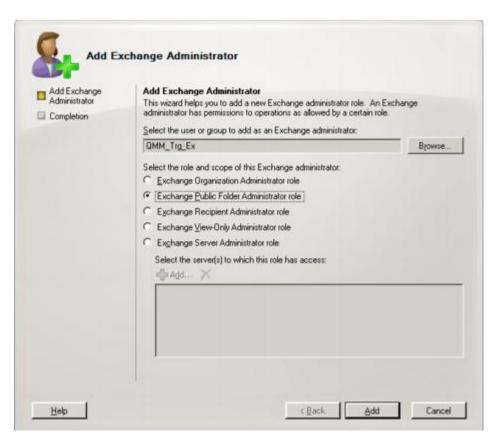

- 1. In the Active Directory Users and Computers snap-in, right-click the Microsoft Exchange System Objects OU and click Properties.
 - NOTE: If there is no Microsoft Exchange System Objects OU, you should select View |
 Advanced Features in the Active Directory Users and Computers snap-in.
- On the Security tab, click Add, and select the Target Exchange Account (in our example, QMM_Trg_Ex).
- Select the account name, and then enable the Allow option for the Full Control permission in the Permissions box.
- 5. Click the **Advanced** button. In the **Advanced Security Settings** dialog box, select the account you specified on step 2, and click **Edit**.
- In the Permission Entry dialog box, select This object and all child (descendant) objects from the Apply onto drop-down list.
- 7. Close the dialog boxes by clicking **OK**.

To make sure the above actions were performed correctly, please view the Manage Full Access and Manage Send As dialogs in Exchange Management console. You should see the service account in both of the above dialogs.

Granting the Exchange Public Folder Administrator Role

The Target Exchange Account requires the **Exchange Public Folder Administrator** role. To grant it, complete the following steps:

- 1. Launch the Exchange Management Console.
- 2. Click the **Organization Configuration** node. **Exchange Administrators** tab will appear on in the right pane.
- 3. Right-click anywhere in the **Exchange Administrators** tab and select **Add Exchange Administrator** from the shortcut menu.
- 4. In the **Add Exchange Administrator** dialog box click **Browse**, select the Target Exchange Account (in our example, **QMM_Trg_Ex**) and click **OK**.
- 5. Select the Exchange Public Folder Administrator role option and click Add.

- 6. Click Finish to exit the wizard and apply your changes.
- CAUTION: If the Target Exchange Account is located in another trusted forest, you cannot assign the Exchange Public Folder Administrator role to this account. In this case grant the following permissions for the Exchange Administrative Group (FYDIBOHF23SPDLT) container and its child objects to the account in the Configuration partition using the ADSIEdit snap-in:
 - Modify public folder replica list permission
 - Modify public folder deleted item retention permission
 - . Modify public folder quotas permission

Setting Up the Target Active Directory Account

This section describes how to set the required permissions for the Target Active Directory Account used by Migration Manager for Exchange agents. This account is used for the following:

- · Working with the target Active Directory
- · Re-homing mailboxes
- Switching mailboxes (Migration Agent for Exchange)
- Switching mailboxes and synchronize mailboxes in Remote Users Collections (Mail Source Agent, Mail Target Agent)

The required permissions for the Target Active Directory Account are as follows:

- Read access to the target domain
- Full Control permission on the organizational units (OUs) (and their child objects) where the target synchronized objects are located.
- Read permission for the Microsoft Exchange container in the target Active Directory

To set up the Target Active Directory Account, perform the steps described in the related subtopics.

NOTE: Note that these steps are given only as an example of a possible Target Active Directory Account setup.

Changing Default Active Directory Account

CAUTION: This section is relevant to the public folder synchronization only. Active Directory Account for mailbox or calendar synchronization is specified during corresponding job configuration.

The default Source or Target Active Directory Account (initially displayed on the Associated domain controller page of the Exchange server's properties) is set when you add the source or target organization to the migration project (see the *Registering Source and Target Organizations* section of the **Migration Manager for Exchange User Guide** for details).

To change the Source or Target Active Directory Account, click **Modify** on the **General | Associated domain controller** page of the corresponding source (target) server properties in the Migration Manager for Exchange Console.

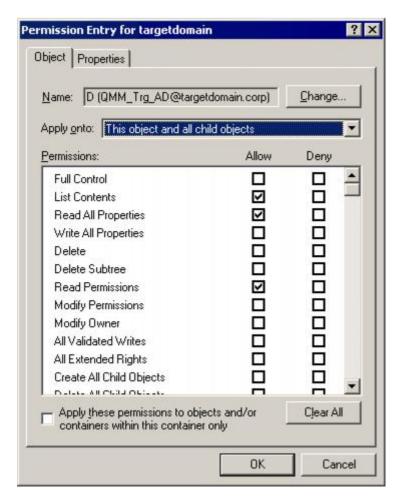

To go on using the default Source (Target) Active Directory Account for Exchange migration, grant the permissions required for Exchange migration to this account (see the next steps).

Granting Read Access to Active Directory Domain

The Target Active Directory Account used by Migration Manager for Exchange agents needs **Read** access to the target domain to work with servers and target Active Directory.

To grant this permission to the account, complete the following steps:

- 1. On the target domain controller in the **Active Directory Users and Computers** snap-in, right-click the domain name, and then click **Properties** on the shortcut menu.
- On the Security tab, click Add and select the account to which you wish to assign permissions (in our example, QMM_Trg_AD).
 - NOTE: If there is no Security tab, you should select View | Advanced Features in the Active Directory Users and Computers snap-in.
- Select the account name, and then enable the Allow option for the Read permission in the Permissions box.
- 4. Click the **Advanced** button. In the **Advanced Security Settings** dialog box, select the account you specified on step 2 and click **Edit**.
- 5. In the **Permission Entry** dialog box, select **This object and all child (descendant) objects** from the **Apply onto** drop-down list.

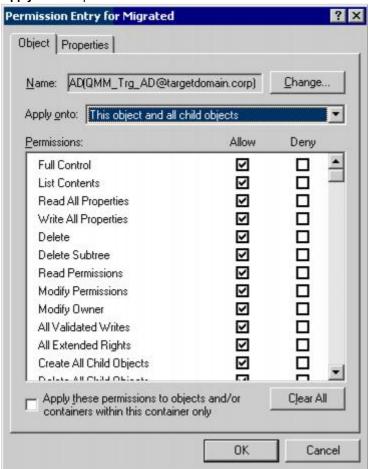

6. Close the dialog boxes by clicking OK.

Granting Full Control on Organizational Unit (Target Active Directory Account)

To work with the target Active Directory objects, the Target Active Directory Account needs the **Full Control** permission on the organizational units and their child objects that contain the objects to be synchronized. This permission should be set on the domain controller where the objects you need to synchronize are located. To grant the required permissions to the account, perform the following steps:

- 1. In the **Active Directory Users and Computers** snap-in, right-click the OU where the objects are located, and click **Properties**.
- 2. On the **Security** tab, click **Add**, and select the Target Active Directory Account (in our example, **QMM_Trg_AD**).
 - NOTE: If there is no Security tab, you should select View | Advanced Features in the Active Directory Users and Computers snap-in.
- 3. Select the account name, and then enable the **Allow** option for the **Full Control** permission in the **Permissions** box.

- 4. Click the **Advanced** button. In the **Advanced Security Settings** dialog box, select the account you specified on step 2, and click **Edit**.
- 5. In the **Permission Entry** dialog box, select **This object and all child (descendant) objects** from the **Apply onto** drop-down list.

6. Close the dialog boxes by clicking OK.

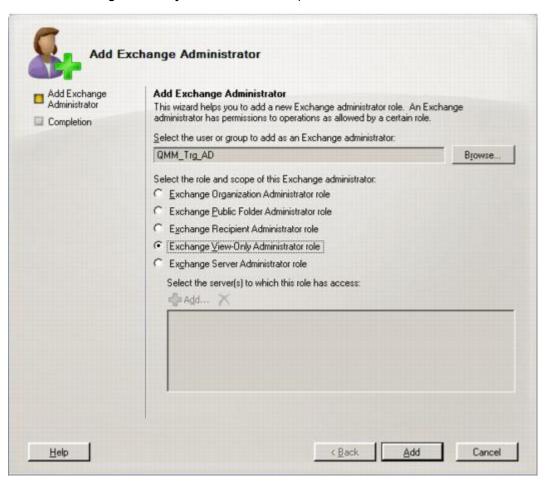

Granting Read Permission for the Microsoft Exchange Container

In the target Exchange 2007 organization, the Target Active Directory Account requires the **Read** permission on the **Microsoft Exchange** container in the target Active Directory.

To grant this permission to the account, complete the following steps:

- 1. Run the Exchange Management Console.
- 2. Click the **Organization Configuration** node. The **Exchange Administrators** tab will appear on the right pane.
- 3. Right-click anywhere in the Exchange Administrators tab and select Add Exchange Administrator from the shortcut menu.

- 4. In the **Add Exchange Administrator** dialog box click **Browse**, select the Target Active Directory Account (in our example, **QMM_Trg_AD**) and click **OK**.
- 5. Select the Exchange View-Only Administrator role option and click Add.

- 6. Click Finish to exit the wizard and apply your changes.
- CAUTION: If the Target Active Directory Account is located in another trusted forest, you cannot assign the Exchange View-Only Administrator role to this account. In this case grant the Read permission for the Microsoft Exchange container and its child objects to the account in the Configuration partition using the ADSIEdit snap-in.

Setting Up the Agent Host Account

This section describes how to set the required permissions for the Agent Host Account used by Migration Manager for Exchange agents. This account is used to install and run Migration Manager for Exchange agents on agent hosts and to access the license server. The required privileges for the Agent Host Account are as follows:

• Membership in the local **Administrators** group on the license server (unless alternative credentials are used for the license server). If server is located in another trusted forest, the account should have local

Administrator permissions on the license server

- · Local Administrator permissions on the agent host server.
- Permission to create, read and write SCP in domain where agent host resides. The SCP object is located in the CN=Exchange Migration Project,CN=QmmEx,CN=Migration Manager,CN=Quest Software,CN=System,DC=eternity,DC=<...>,DC=<...> Active Directory container.
- The **db_owner** role on the SQL server where the database resides. Note that this permission is required if you use **Windows authentication** option for connecting to SQL Server.
- NOTE: By default each Exchange server is an agent host for itself. If you use the default agent host then to simplify the account setup process, you can grant these permissions to the Exchange Account and use it instead of the Agent Host Account.

To set up the Agent Host Account, perform the steps described in the related subtopics.

NOTE: Note that the steps are given only as an example of a possible Agent Host Account setup.

Changing the Default Target Agent Host Account

The default Target Agents Host Account (initially displayed on the **Default Agent Host** page of the Exchange server Properties) is set when you add the target organization to migration project (see the *Registering Source* and *Target Organizations* section of the *Migration Manager for Exchange User Guide* for details).

If necessary, you can change the default Target Agent Host Account by clicking **Modify** on the **General | Default Agent Host** page of the corresponding target server properties in the Migration Manager for Exchange Console.

To go on using the default Target Agent Host Account for Exchange migration, grant the permissions required for Exchange migration to this account (see the next steps).

Granting Membership in the Local Administrators Group on the License Server

The Target Agent Host Account should be a member of the local **Administrators** group on the license server (unless alternative credentials are used for the license server).

I CAUTION:

- If license server is a domain controller, the account should be added to the domain local Administrators group of the domain.
- Local Administrator permissions are required on the license server if this license server is located in another trusted forest.

To add the Agent Host Account to the local **Administrators** group on the license server perform the following:

- 1. Open the Computer Management snap-in (Click Start | Run, enter compmgmt.msc and then click OK).
- 2. In the left pane click System Tools | Local Users and Groups | Groups.
- 3. Right-click the Administrators group and click Add to Group.
- 4. Click Add and select the Target Agent Host Account (in our example, QMM_Src_AH).
- 5. Close the dialog boxes by clicking **OK**.

Preparing the Target Exchange Environment for Exchange Migration

Perform the steps described in the related subtopics to ensure that your Exchange environment is ready for migration:

- · Backing Up Exchange
- Creating Aelita EMW Recycle Bin Public Folder (Optional)
- Creating Administrator Mailboxes for Public Folder and Free/Busy Synchronization
- Creating Administrator Mailboxes for Mailbox and Calendar Synchronization (Optional)
- Installing the Microsoft Exchange Server MAPI Client and Collaboration Data Objects 1.2.1
- Specifying displayName Value for Target Exchange 2007 Mailbox Database Objects
- · Configuring the NSPI Connection Limit

Backing Up Exchange

Before implementing Migration Manager for Exchange in your production environment, back up your Exchange infrastructure. We recommend that Active Directory data be backed up at least twice a day during migration.

Transaction Log File Cleanup

When Migration Manager for Exchange synchronizes mail, for every megabyte of data migrated from the source to the target, a transaction log file of equal size is generated on the target Exchange server. Exchange-aware backup applications purge the transaction logs after the backup completes. By the time the backup finishes, all logged transactions have already been applied to the store and backed up to tape, making log cleaning safe. Large transaction logs that are generated during mailbox migration quickly occupy free disk space. To work around this problem, perform one of the following:

- If a full backup strategy is implemented in the organization or there is no backup strategy at all, then circular logging may be enabled for unattended log deletion.
- If an incremental or differential backup strategy is already implemented in the organization, then make sure that logs are cleared automatically when backup process is finished. Do not enable circular logging in this case.

Note also that Microsoft recommends turning OFF circular logging on the Exchange server. For more information, refer to Microsoft Knowledge Base article 147524: XADM: How Circular Logging Affects the Use of Transaction Logs.

Creating Aelita EMW Recycle Bin Public Folder (Optional)

CAUTION: If you skip this step, you must manually turn off using the Aelita EMW Recycle Bin folder during public folder synchronization (set the UseRecycleBin parameter to 0). See the Use Fine-Tuning the Agents section of the Migration Manager for Exchange User Guide for details.

If you plan to perform public folder synchronization using Migration Manager Public Folder agents, you should create a special public folder called **Aelita EMW Recycle Bin.** Replicate this folder to all the public folder servers involved in the public folder synchronization process.

This folder will help prevent data loss in case of accidental public folder deletion. When a public folder is deleted in one of the environments, the public folder synchronization agents move the corresponding folder in the other environment to the **Aelita EMW Recycle Bin** folder, if it exists, instead of permanently deleting the folder. You can use this folder to check whether important information has been deleted, and restore any data deleted by mistake.

CAUTION: Only deleted public folders will be put into the Aelita EMW Recycle Bin. If you delete a message from a public folder, it will be destroyed permanently in both the Source and Target Exchange organizations.

Creating Administrator Mailboxes for Public Folder and Free/Busy Synchronization

Administrator mailboxes should be created on all Exchange servers involved in public folder and free/busy synchronization. These mailboxes will be used to access the public folder tree and the Schedule+ Free/Busy folder when creating public folder and free/busy synchronization jobs.

The administrative mailbox selected for public folder synchronization should reside in a private mailbox database located on the same server as the public folder database. The mailbox database should be also associated with that public folder database. To set this association, in **Exchange Management Console** open properties of the mailbox database and specify the public database as **Default public folder database** on the **Client Settings** tab.

CAUTION:

- The administrator mailbox specified for the synchronization job should not be changed during the synchronization process.
- The administrator mailboxes should not be included in mailbox or calendar synchronization jobs.

Creating Administrator Mailboxes for Mailbox and Calendar Synchronization (Optional)

Mailbox and calendar synchronization agents access the migrated mailboxes via the administrator mailbox. By default, the Microsoft System Attendant mailbox is used as the administrator mailbox on Exchange 2007 servers. However, in some cases it is necessary to create custom administrator mailboxes and use them instead of the Microsoft System Attendant mailbox.

Installing the Microsoft Exchange Server MAPI Client and Collaboration Data Objects 1.2.1

Migration Manager needs version 6.5.8353.0 or later of Microsoft Exchange Server MAPI Client and Collaboration Data Objects 1.2.1 to be installed on the computers where Migration Manager agents will run (that is, Exchange 2007 and 2010 Servers and agent hosts only).

Since the MAPI CDO setup package is not available for distribution, you should download it from the Microsoft Web site. At the moment of the last document update, the download link is http://www.microsoft.com/en-us/download/details.aspx?id=42040.

After installing the API, restart the computer.

Specifying displayName Value for Target Exchange 2007 Mailbox Database Objects

Mailbox databases in Exchange 2007 organizations are created with blank **displayName** parameters. As a result, some agents may stop working. To resolve this issue, you have to specify the **displayName** values for the target Exchange 2007 mailbox databases. You can do it either manually, as described in the related subtopics, or using the **SetStoreDisplayName.js** script located in the **QMMEx Reskit\Scripts** folder on the Migration Manager for Exchange Installation CD. You must run the script after you install Migration Manager for Exchange.

To specify the displayName value for the target Exchange 2007 mailbox database objects

- Launch the ADSIEdit utility from the Windows Support Tools: click Start | Run and type in ADSIEdit.msc. Click OK.
 - NOTE: If you have Windows 2003 domain controller the ADSIEdit utility, which is part of the Windows 2003 Support Tools may not be installed. In this case install the Support Tools by running the Support\Tools\Suptools.msi file located on the Windows 2003 CD.
- In the ADSIEdit snap-in, browse to the container named CN=Exchange Administrative Group (FYDIBOHF23SPDLT), CN=Administrative Groups,CN=<ExchangeOrganizationName>, CN=Microsoft Exchange,CN=Services,CN=Configuration, DC=<...>,DC=<...>
- For each Exchange 2007 server involved on the migration steps, open the container named CN=<StorageGroup>,CN=InformationStore,CN=<ServerName>,
 CN=Servers,CN=Exchange Administrative Group (FYDIBOHF23SPDLT),
 CN=Administrative Groups,CN=<ExchangeOrganizationName>,
 CN=Microsoft Exchange,CN=Services,CN=Configuration,
 DC=<...>,DC=<...>
- 4. Then, for each mailbox database, right-click the database object and select **Properties** from the shortcut menu.
- 5. On the **Attribute Editor** tab, copy the **adminDisplayName** attribute value to the **displayName** attribute value and click **OK**.
- 6. Click **OK** to apply the settings and close the dialog box.

Configuring the NSPI Connection Limit

IMPORTANT: This step must be performed only if you have any Windows Server 2008 or later domain controllers acting as Global Catalog.

By default, the maximum number of simultaneous Name Service Provider Interface (NSPI) connections equals to 50 per user for Windows Server 2008 or later domain controllers. Therefore, to avoid possible issues related

to exceeding that value, you may need to increase the NSPI connection limit on all Windows Server 2008 or later domain controllers acting as Global Catalog. The recommended limit value equals the number of agent instances working simultaneously multiplied by 5.

To change the default connection limit for a domain controller, take the following steps:

- 1. Click Start, click Run, type regedit, and then click OK.
- Locate and then click the following registry subkey:
 HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\NTDS
- 3. Click the Parameters key.
- 4. On the Edit menu, point to New, and then click DWORD Value.
- 5. Type NSPI max sessions per user, and then press Enter.
- Double-click NSPI max sessions per user, type the appropriate maximum number of the NSPI connections, and then click OK.
- 7. Restart the computer or restart Active Directory Domain Services.

For additional information, see the following Microsoft Support articles:

- Error: "Trying to connect to Microsoft Exchange Server" results in MAPI_E_LOGON_FAILED
- NSPI connection to a Windows-based domain controller causes MAPI client applications to fail and returns a "MAPI_E_LOGON_FAILED" error message

Setting Up Connection with the Source Exchange Organization Using SMTP Connectors

This section describes how to set up a connection with the source Exchange organization using SMTP connectors. On this step you may need to coordinate with the administrator of the source Exchange organization to set up the connection properly.

For more details, see the related topics:

- Setting up Target Exchange Organization for Internet Mail Flow between Target and Source Exchange Organizations
- Configuring Target DNS Server for Mail Forwarding
- Testing the SMTP Connectors (Optional)

Setting up Target Exchange Organization for Internet Mail Flow between Target and Source Exchange Organizations

You need to establish Internet mail flow between the target and the source Exchange organizations. For that, one of the following methods can be used:

- Establishing Internet mail flow directly through a Hub Transport server.
- Establishing Internet mail flow through a subscribed Edge Transport server.

Establishing Internet Mail Flow Directly Through a Hub Transport Server

If you choose this option, you need to create an **Internet Send** connector and **Receive** connector on an Exchange 2007 Hub Transport server that can be directly reached through the Internet.

To establish mail flow to and from the Internet through a Hub Transport server, follow these steps:

- 1. Create a Send connector (to send email from source (target) Exchange 2007 organization to the Internet) on the Hub Transport server.
- 2. Modify the default Receive connector for the source (target) domain to accept anonymous e-mail from the Internet
- 3. Add the e-mail domain used for redirection to the list of accepted domains on the Hub Transport server.

Each step is explained in further detail in the related subtopics.

- NOTE: For information about configuring Receive connectors in Exchange 2007 organization, refer to the following Microsoft Knowledge Base articles:
 - · How to Allow Anonymous Relay on a Receive Connector
 - Creating a Receive Connector that Grants Anonymous Relay to Specific Source IP Addresses
 - Configure the Receive Connector as Externally Secured

Creating Send Connector

To create a Send connector, you can use either Exchange Management Console or Exchange Management Shell.

To create a Send connector using Exchange Management Console

- 1. Open the Exchange Management Console. Select Organization Configuration | Hub Transport.
- 2. In the action pane, click New Send Connector. The New SMTP Send Connector wizard runs.
- When prompted, in the Name field, type a unique name for the connector, for example, "QMM Send Connector." From the Select the intended use for this Send connector drop-down list, select Custom, and then click Next.

- 4. On the Address space page, click Add. In the dialog box displayed, specify the address space you want to use for mail redirection from source to target (target to source) organization (for example, *.target.local or *.source.local), select the Include all subdomains option, click OK and then click Next.
- 5. On the Network settings page, select Use Domain Name System (DNS) "MX" records to route mail automatically. Select the Use the External DNS Lookup settings on the transport server option.
- 6. Next, on the **Source Server** page, click **Add**. In the dialog box displayed, select one or more **Hub Transport** servers in your organization, click **OK** and then click **Next**.
- 7. Finally, on the New Connector page, click New, and then on the Completion page, click Finish.

To create a Send connector using Exchange Management Shell

Run the following command for the source Exchange organization:

```
new-SendConnector -Name 'QMM Send Connector' -Usage 'Custom' -AddressSpaces
'SMTP:*.target.local;1' -IsScopedConnector $false -DNSRoutingEnabled $true -
UseExternalDNSServersEnabled $true -SourceTransportServers 'ServerName'
```

where:

- *.target.local is the address space you want to use for mail redirection from source to target organization.
- · ServerName is the Hub Transport server name.

Run the following command for the target Exchange organization:

```
new-SendConnector -Name 'QMM Send Connector' -Usage 'Custom' -AddressSpaces
'SMTP:*.source.local;1' -IsScopedConnector $false -DNSRoutingEnabled $true -
UseExternalDNSServersEnabled $true -SourceTransportServers 'ServerName'
```

where:

- *.source.local is the address space you want to use for mail redirection from target to source organization.
- ServerName is the Hub Transport server name.

Modifying Default Receive Connector

To modify the default Receive connector for the source or target Exchange 2007/2010 organization to receive mail from the Internet, you can use either Exchange Management Console or Exchange Management Shell.

To modify the default Receive connector using Exchange Management Console

- 1. Run Exchange Management Console. Select the **Server Configuration | Hub Transport** node.
- 2. In the **Hub Transport** pane select the appropriate Hub Transport server.
- 3. On the Receive Connectors tab, select the Default <Server Name> connector. In the Actions pane, click Properties for this connector.
- 4. In Default <Server Name> Properties dialog box, open the Permission Groups tab.
- 5. Select Anonymous Users to add anonymous permissions.
- 6. Click **OK** to apply the settings.

To modify the default Receive connector using Exchange Management Shell

Run the following command:

Set-ReceiveConnector -PermissionGroups 'AnonymousUsers, ExchangeUsers, ExchangeServers, ExchangeLegacyServers' -Identity 'ServerName\Default ServerName'

Where ServerName is the Hub Transport server name.

Adding E-mail Domain Used for Redirection to the List of Accepted Domains on Hub Transport Server

To add a new Accepted domain on a computer that has the Hub Transport server role installed, you can use either Exchange Management Console or Exchange Management Shell.

To add a domain to Accepted Domains list using Exchange Management Console

- 1. Run the Exchange Management Console and select the **Organization Configuration | Hub Transport** node.
- 2. In the Actions pane, click New Accepted Domain. This will start the New Accepted Domain wizard.
- 3. On the first page, provide the following information:
 - Name—Specify the accepted domain in the user interface, such as source.local (target.local).
 - Accepted Domain—Specify the SMTP namespace for which the Exchange organization will accept e-mail messages, such as *.source.local (*.target.local).
- 4. Select the Authoritative Domain. E-mail is delivered to a recipient in this Exchange organization option for the accepted domain type.
- 5. Click New.
- 6. On the Completion page, click Finish.

To add a domain to Accepted Domains list using Exchange Management Shell

Run the following command for the source Exchange organization:

```
new-AcceptedDomain -Name 'source.local' -DomainName '*.source.local' -DomainType
'Authoritative'
```

where *.source.local is the address space you want to use for mail redirection from the target to the source organization.

Run the following command the target Exchange organization:

```
new-AcceptedDomain -Name 'target.local' -DomainName '*.target.local' -DomainType
'Authoritative'
```

where *.target.local is the address space you want to use for mail redirection from the source to the target organization.

Establishing Internet Mail Flow through a Subscribed Edge Transport Server

The second option for establishing Internet mail flow between the target and the source Exchange organizations (or between the source and the target Exchange organizations) is to subscribe the **Edge Transport** server to an

Active Directory site. The connectors that establish mail flow to the Internet are created automatically when you subscribe an Edge Transport server to an Active Directory site by using the Edge Subscription process.

Before you begin this procedure, verify that the following prerequisites are met:

- · Authoritative domains are configured on the Hub Transport server.
- E-mail address policies are configured on the Hub Transport server.
- Network communications over the secure LDAP port 50636/TCP are enabled through the firewall separating your perimeter network from the Exchange organization.

To establish mail flow to and from the Internet through a subscribed Edge Transport server, follow these steps:

- 1. Export the Edge Subscription file from the Edge Transport server.
- 2. Import the Edge Subscription file on the Hub Transport server.
- 3. Force EdgeSync synchronization to begin on the Hub Transport server.

Each step is explained in further detail in the related subtopics.

Export the Edge Subscription file from the Edge Transport Server

1. Run the following command on the Edge Transport server, providing the complete file path of the Edge Subscription file that you are creating.

```
New-EdgeSubscription -FileName "C:\EdgeSubscriptionInfo.xml"
```

2. Copy the resulting XML file to the Hub Transport server.

Import the Edge Subscription file on the Hub Transport Server

On the Hub Transport server, run the following command:

```
New-EdgeSubscription -filename "C:\EdgeSubscriptionInfo.xml" -
CreateInternetSendConnector $true -CreateInboundSendConnector $true -site "Site-Name"
```

Where Site-Name is the name of Active Directory site where the Hub Transport server is located.

Force EdgeSync Synchronization

To force EdgeSync synchronization, run the following command from the Exchange Management Shell on the Hub Transport server:

Start-EdgeSynchronization

Configuring Target DNS Server for Mail Forwarding

After you have completed setting up the target Exchange 2007/2010 organization for Internet mail flow between target and source Exchange organizations, you should also add the Mail Exchanger (MX) record for the target domain to the DNS server. This is necessary to forward the mail (redirected to the additional SMTP addresses added by the Directory Synchronization Agent) to the target Exchange 2007/2010 server.

We will use the following additional address space given as example on the steps above:

 @target.local—to redirect mail from source to target mailboxes. A secondary SMTP address will be added to each target mailbox by the Directory Synchronization Agent according to this template.

To set MX record for the target domain

- In the DNS snap-in, connect to the target DNS server and browse to the Forward Lookup Zones container.
- 2. Right-click the Forward Lookup Zones and select New Zone.
- 3. In the New Zone wizard, select the Primary zone to be created.
- 4. Type local for the Zone name and complete the wizard.
- 5. Right-click the zone object local again, and click New Mail Exchanger on the shortcut menu.
- 6. In the New Resource Record dialog box, type target for the Host or child domain.
- 7. Click **Browse** and select the Exchange server in the target domain to which mail sent to the *@target.local* domain will be redirected.
- 8. Click OK.

Testing the SMTP Connectors (Optional)

After both source and target Exchange organizations have been set up for Internet mail flow as well as both source and target DNS servers have been configured for mail forwarding, it is recommended to test the connection between the source and the target organizations.

CAUTION: This step should be performed in coordination with the administrator of the Exchange organization.

To test the SMTP connectors:

- 1. Create test mailboxes on the source and target Exchange servers. In this example, both mailboxes will be called **mbx1**.
- 2. Set the same primary SMTP address for both mailboxes.
- 3. In this example the primary address for both mailboxes will be mbx1@Westland.Exchange.com.
- 4. Set additional addresses for both mailboxes.
- 5. In this example additional address for the source mailbox will be **mbx1@source.local**, and **mbx1@target.local** for the target mailbox.
- 6. Create a contact on the source Exchange server and point it to the additional SMTP address of the target Exchange mailbox (mbx1@target.local).
- Create a contact on the target Exchange server and point it to the additional SMTP address of the source mailbox (mbx1@source.local).
- 8. Open the test source mailbox and send a message to the source contact.
- 9. Open the test target mailbox and make sure that the message has arrived.
- 10. From the test target mailbox, send a message to the target contact, and make sure the e-mail has reached the source test mailbox.

Exchange 2003 to Exchange 2007 Migration Restrictions

Public folder stores are no longer mandatory for Exchange 2007 organizations. However, if Exchange 2007 organization does not have a public folder store and MSA or CSA is installed directly on the source Exchange 2003 server, then the Exchange 2003 to Exchange 2007 migration scenario is not supported.

To work around that issue, you need to use separate agent hosts for MSA or CSA instead of installing them directly on the source Exchange 2003 server.

NOTE: For detailed information about system requirements for agent hosts, see the Exchange Migration Agents section of the System Requirements and Access Rights document.

About us

Quest provides software solutions for the rapidly-changing world of enterprise IT. We help simplify the challenges caused by data explosion, cloud expansion, hybrid datacenters, security threats, and regulatory requirements. We are a global provider to 130,000 companies across 100 countries, including 95% of the Fortune 500 and 90% of the Global 1000. Since 1987, we have built a portfolio of solutions that now includes database management, data protection, identity and access management, Microsoft platform management, and unified endpoint management. With Quest, organizations spend less time on IT administration and more time on business innovation. For more information, visit www.quest.com.

Technical support resources

Technical support is available to Quest customers with a valid maintenance contract and customers who have trial versions. You can access the Quest Support Portal at https://support.quest.com.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- · Submit and manage a Service Request
- · View Knowledge Base articles
- · Sign up for product notifications
- · Download software and technical documentation
- · View how-to-videos
- · Engage in community discussions
- Chat with support engineers online
- · View services to assist you with your product
