KACE® Desktop Authority 11.1

Reporting Guide

Desktop Authority - Reporting Guide
Updated - December 2019
Version - 11.1

Contents

Reporting overview*

The Reporting object presents the opportunity to run predefined reports distributed with Desktop Authority® or the ability to create custom reports. Reports can be run manually at any time or may be scheduled to run on a specific and/or recurring Date/Time.
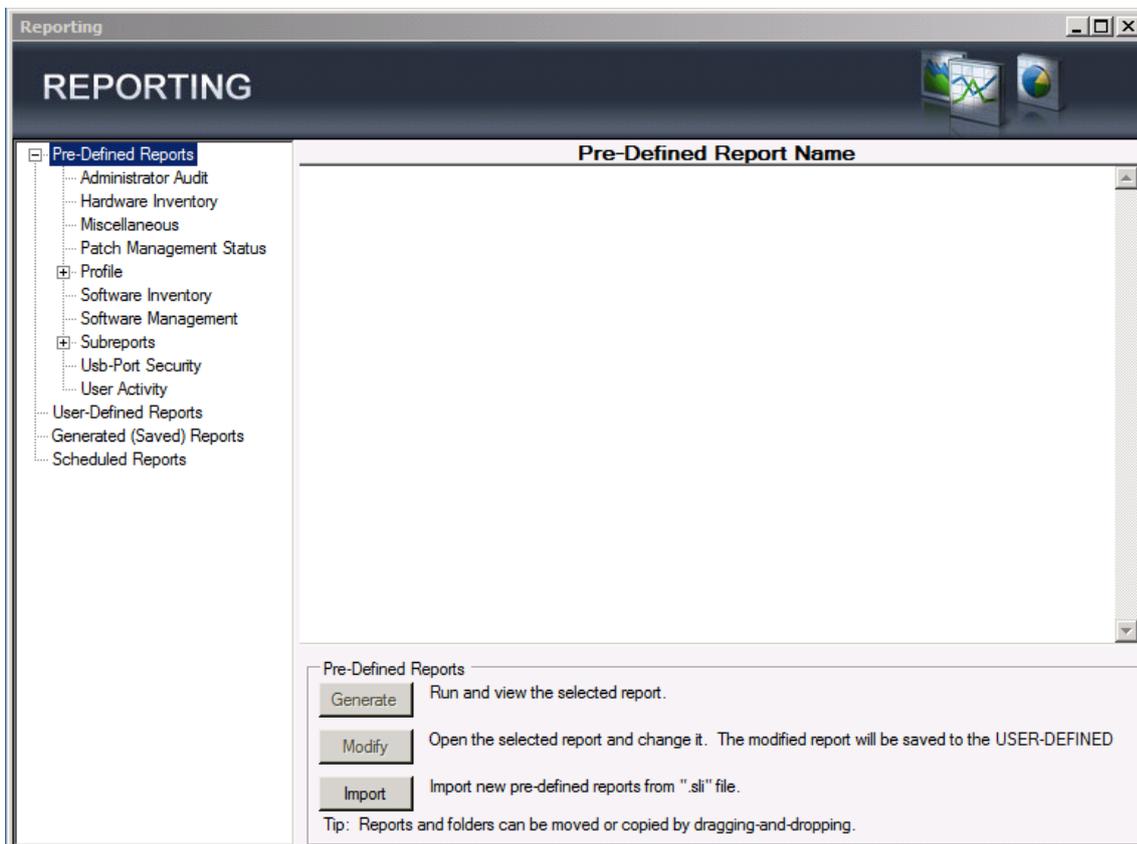

Pre-defined reports

Select a report category from the Pre-Defined Reports tree. The Pre-Defined Reports object contains reports distributed with Desktop Authority. Click **Generate** or double-click a report in the report list to execute the selected report. Click **Import** to gather new report templates made available for Desktop Authority .

User-defined reports

Select User-defined Reports from the reporting tree. The User-defined Reports object lists reports that have been modified from the original supplied reports or newly created reports. Click **New** to create a new user-defined report or use the Wizard interface by clicking **Wizard**. Click **Modify** or double-click a report in the report list to open the selected report for changes. Click **Generate** to run and view the selected report. Click **Delete** to remove the selected report. Click **Import** to gather a user-defined .sli file into the user-defined report repository. Click **Export** to create a user-defined .sli file based on one or more reports in the user-defined report repository. User-defined reports can be categorized into separate folders. Click **New Folder** to create a new repository folder. Click **Delete Folder** to remove a repository folder. Rename an existing folder by clicking **Rename Folder**.

Generated (saved) reports

Select Generated (Saved) Reports from the reporting tree. Saved reports are reports that have been run as a Scheduled Report. Click **View** or double-click a report in the report list to display the selected report. Click **Delete** to remove the selected report.

Scheduled reports

Select Scheduled Reports from the reporting tree. The Scheduled Reports object defines a schedule for a selected report to be run automatically. Scheduled reports can accept parameters and can be defined to run one or more times. The schedule can also email the report to a destination once it is run. Click **New** to create a new schedule for a report. Click **Modify** or double-click a report in the report list to change the scheduled settings for a report. Click **Delete** to delete the selected scheduled report.

Scheduled reports are saved to the User-Defined report repository.

Enable/Disable report data collection

User and Computer Data is collected by Desktop Authority's Operations Master service and the ETLProcessor plugin. The ETLProcessor plugin is available in the Server Manager > Plugins tab for configuration.

Data Collection can be configured for both the User and Computer in their respective Data Collection profile objects. Computer Management Data Collection can be configured for hardware, software, Patch Management, USB/Port Security and Startup/Shutdown information. User based Data Collection can be configured for login/logoff and lock/unlock events.

ⓘ *Note: This feature is not a standard part of Desktop Authority Essentials. To obtain this feature, Desktop Authority Essentials must be upgraded to the full version of Desktop Authority..

Creating a simple report

The following steps show how to create a simple report. Review the Tips and Techniques to learn about advanced reporting concepts.

1. **Create a New Report**

   Select the Reporting object in the Navigation pane of the Manager. Select the User-Defined Reports category in the Report tree. Once selected, create a new report by right-clicking in the report list area. From the popup menu, select New. The Reporting Tool will open with a blank Report Design Surface. All new reports consist of a Page Header, Detail, and Page Footer.
   A new report can also be created by using the Report Wizard. From the User-Defined Reports menu, click the Report Wizard button. The wizard will automatically populate selected fields to the report layout and generate the necessary SQL statement including sorting and filtering the data. No need to know SQL, the wizard will write it all for you!

2. **Create an SQL statement**

   If not using the Report Wizard, the next step is to define an SQL statement that will connect the report to the data. Desktop Authority provides several default SQL statements to help jump start a report. Select a pre-defined SQL statement from the Change Data Source drop list or click the SQL button and enter your own SQL statement.
   A data dictionary of all tables available has been provided to aid in the process of SQL statement creation. This Data Dictionary can be downloaded from the Quest web site.

3. **Creating Groups**

   A report can consist of single or multiple nested groups, with each group having its own header and footer sections. The header section is inserted and printed immediately before the Detail section. The footer section is inserted and printed immediately after the Detail section. Up to 32 nested groups are allowed in a single report.
   To achieve the desired results, the data needs to be ordered by the field that is to be grouped on. The data must be sorted in the necessary grouping order using the ORDER BY clause on the SQL statement.

   - Right-click in the Detail section of the report design surface, select Insert > Insert Group Header/Footer. This will insert a new group header/footer section into your report around the existing detail section.

   - Set the group by field in the Properties window for the group header. Change the DataField property to the field on which the data is to be grouped.

   - Change the name of the group header to reflect the data that is being grouped. For example, "ghMachineName" could be the name of the group header with the DataField property of "MachineName".

4. **Adding data to the report**

   To add a data field to the report, simply select the field from the Fields toolbox and drag it onto the report design surface. Drop it into the proper report section, i.e. Page Header/Footer, Group Header/Footer, or

Detail. Grouped data fields should be placed into either the Group Header or Footer areas. Most often a grouped data field is placed into the Group Header, leaving the Footer area available for sums or counts on the group data.

Another way to add data to the report is to select a control from the Toolbox. Click on the tool and then click on the area in the report's design surface where the control will be displayed. Before letting go, drag the mouse to size the control. Once the mouse button is released the control will appear.

Once a data field has been added to the report design surface, it may need to be sized and/or properties may need to be set. When the data field is placed on the design surface, it will be given a default name. It is recommended that the (Name) property be changed to reflect a user friendly and recognizable name. This is the name the data field will be referenced as throughout the report. If the control will hold static text, set the Text property to the actual text value.
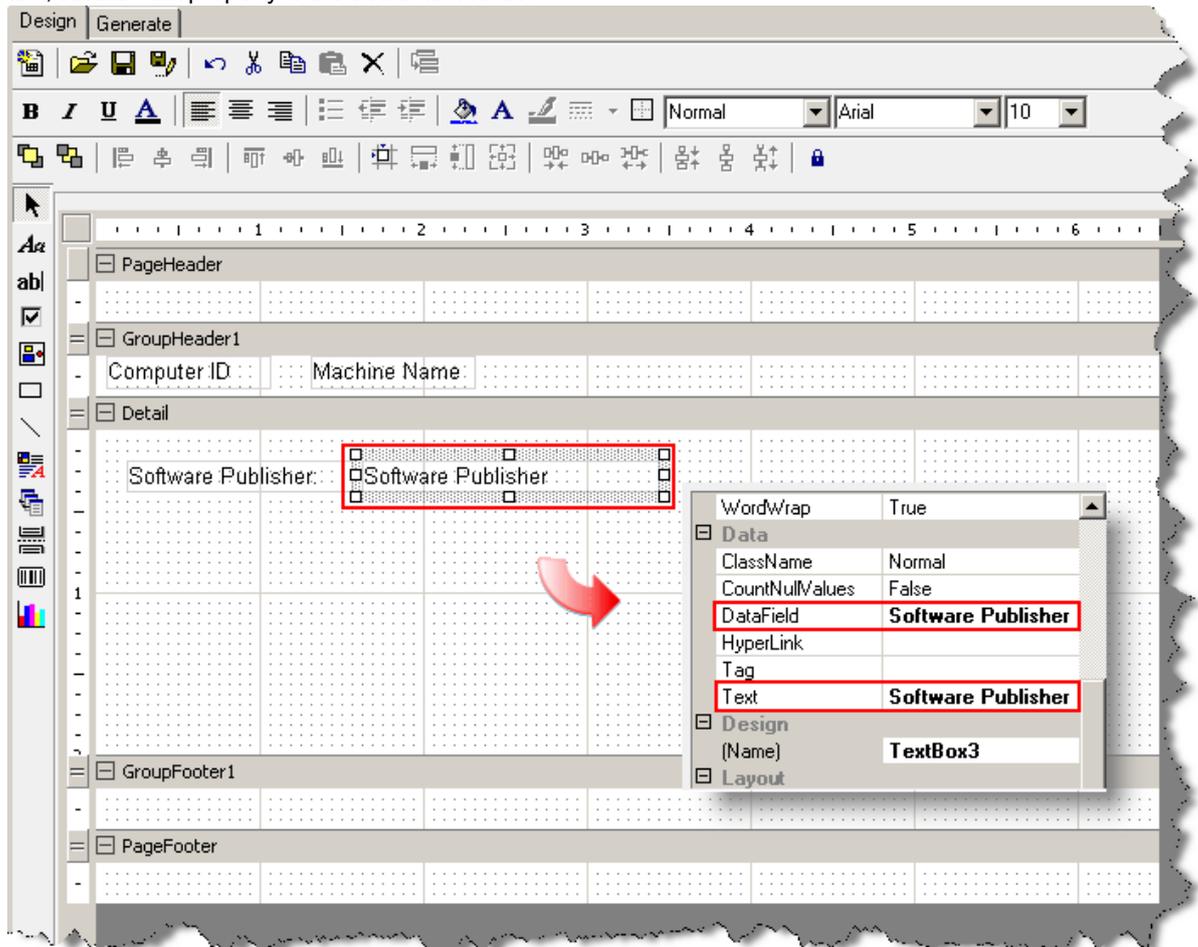

There are many other properties that may be set. Refer to the Properties box reference to read about other properties.

5. **Generate the Report**

   To execute the report while in design mode, click the Generate tab on the top of the report design surface.
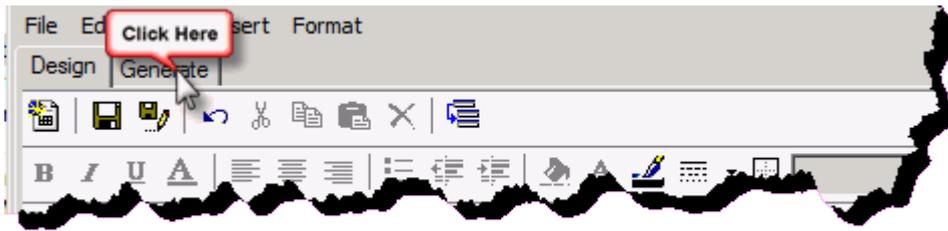

If the report uses runtime parameters, before execution, the user will be prompted to enter the values for the parameters.

6. **Save Report**

Click ![save icon] on the Menu bar to complete and save the report. If the report has not been previously saved in the User Defined report repository, provide a name for the report when prompted. The report will be saved to the User Defined report repository. Reports can not be saved to the Pre-Defined report repository.

Report design interface

The report design surface is made up of a Report Header, Page Header, Detail, Page Footer and Report Footer. Report Headers/Footers and Page Headers/Footers are optional sections of a report. All reports must contain (at the minimum), a single detail section. A Group Header/Footer combination can also be optionally added.
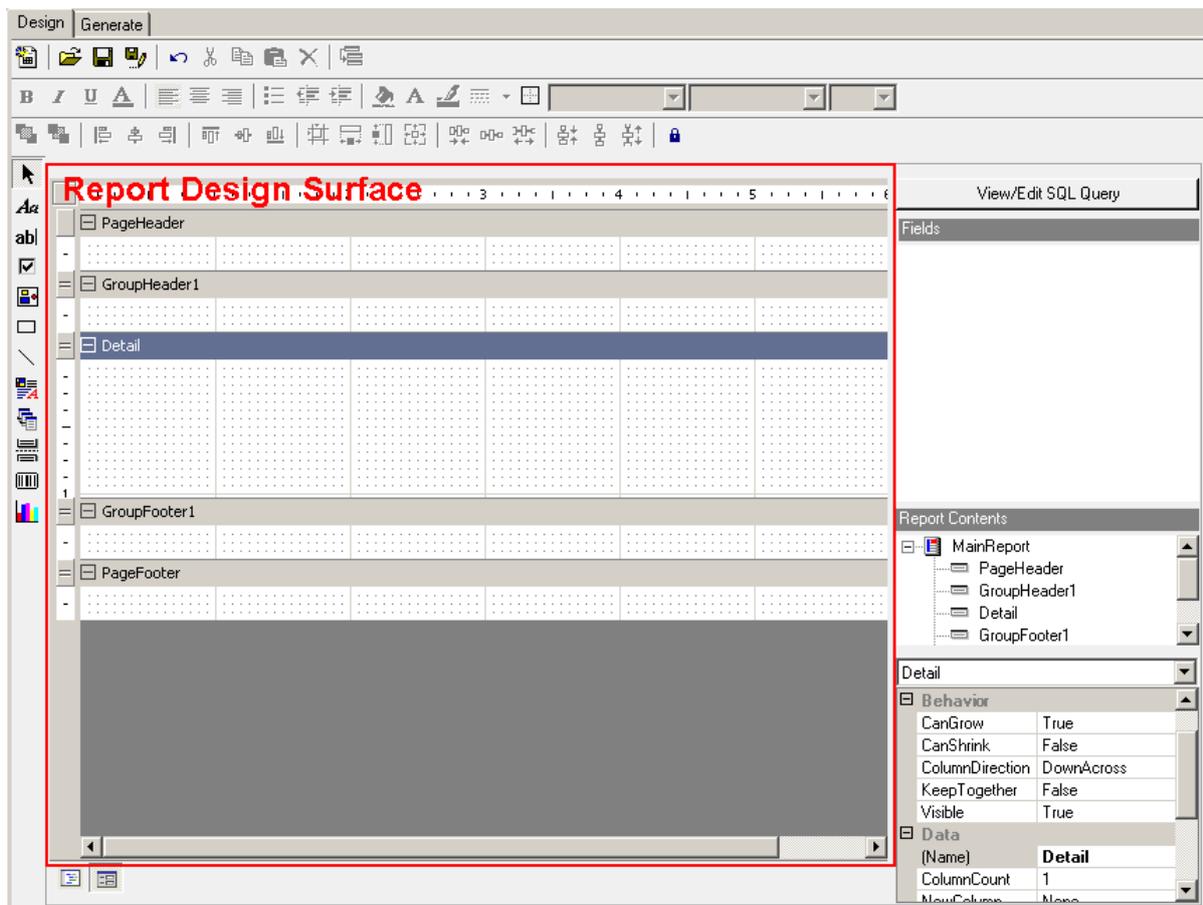

Report sections

- **Report Header**

  A report can have one report header section that prints at the beginning of the report. This section generally is used to print a report title, a summary table, a chart or any information that needs only to appear once at the report's start.

- **Page Header**

  A report can have one page header section that prints at the top of each page. It is the first section that prints on the page except when the page contains a report header section. The page header section is used to print column headers, page numbers, a page title or any information that needs to appear at the top of each page in the report.
  Note: Data bound controls (i.e. textboxes tied to data from a database table) are not supported in the Page Header/Footer sections. They get rendered when the page is started (before the data is read), not when the data is being read for the page. Is a data bound control is placed into the page header/footer, it will appear on the second and subsequent pages, not the first.

- **Details**

  This section is the body of the report that prints once for each record in the data source. The bulk of the report data generally appears in this section.

- **Report Footer**

  A report can have one report footer section that prints at the end of the report. This section is used to print a summary of the report, grand totals or any information that needs to print once at the report's end.

- **Page Footer**

  A report can have one page footer section that prints at the bottom of each page. It is used to print page totals, page numbers or any other information that needs to appear at the bottom of each page.
  Note: Data bound controls (i.e. datafield textboxes) are not supported in the Page Header/Footer sections. They get rendered when the page is started (before the data is read), not when the data is being read for the page. Is a data bound control is placed into the page header/footer, it will appear on the second and subsequent pages, not the first.

- **Group Header/Footer**

  A report can consist of single or multiple nested groups, with each group having its own header and footer sections. The header section is inserted and printed immediately before the detail section. The footer section is inserted and printed immediately after the detail section.
  A group header section typically holds the group name field, and can be used to display charts that include data specific to the group. It is printed once at the beginning of a group when the data for the group changes.
  A group footer section generally holds a group summary value, if any, and can be used to display charts or cross-tabs. It is printed once at the end of a group when the data for the group changes.
  When a group, summary, or subtotal is added, the Group Header area appears directly above the Details area and the Group Footer area appears directly below the Details area.
  As additional groups are added, the group areas are added between the Details area and the existing Group Header and Group Footer area(s).

Modifying section layout

Insert

To add or remove report sections, simply right-click anywhere in the report design surface and select **Insert** from the shortcut menu. From the submenu select either **Insert Report Header/Footer**, **Insert Page Header/Footer**, or **Insert Group Header/Footer**.

Delete

To remove a report section right-click in the header or any empty area of the section to be deleted and select **Delete** from the shortcut menu.

Reorder

When one or more Group Header/Footer sections are part of a report the groups may be reordered after they have been added to the report. Right-click on any header or any empty area of a section and select **Reorder** from the shortcut menu. The Group Order dialog will be displayed.
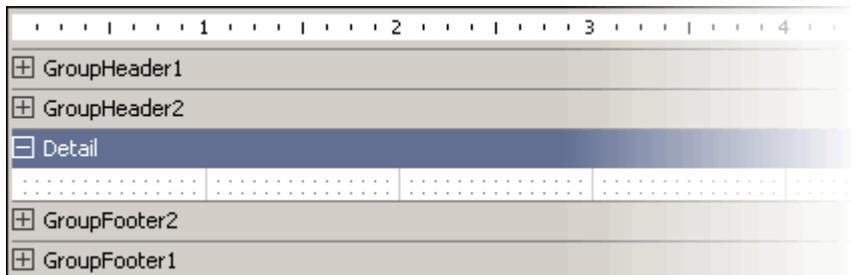

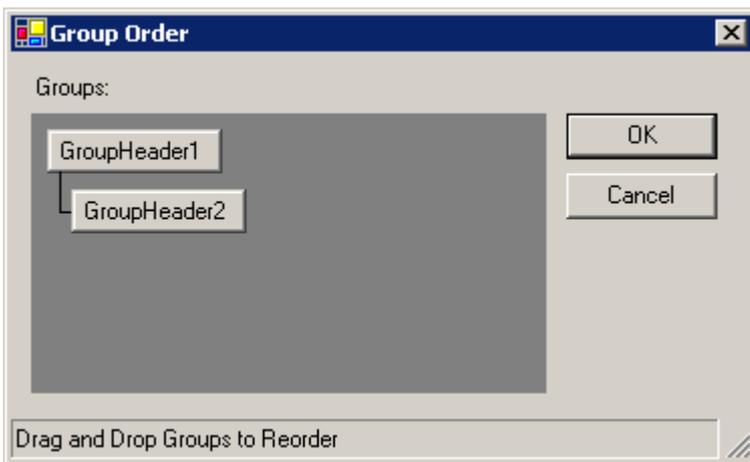

Simply drag a group and drop it on the group that it will be evaluated before.
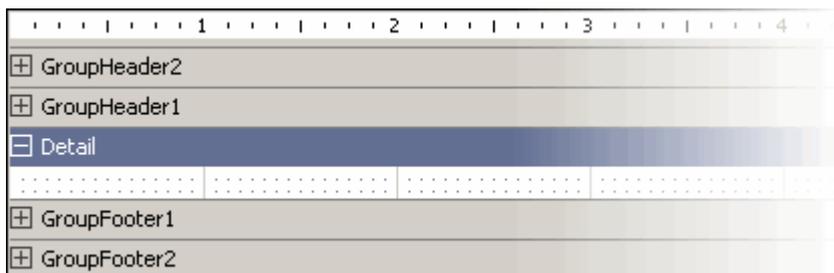

Section properties

When selecting a report section from the Report Contents toolbox (or from the report design surface), the Properties toolbox will automatically display the available properties for that section.

Refer to the Properties Toolbox for details on all properties available.

Controls

Controls are data placeholders which can hold the value of a data field, manually entered text, pictures, and charts, among several other items.

Types of controls

The Reporting tool makes use of several different types of controls. The available controls consist of Label, Textbox, Checkbox, Picture, Shape, Line, Rich Textbox, Subreport, Page Break, Barcode, and Chart. All controls are available for placement on the report from the Toolbox toolbar. For a description of each control type, refer to the Toolbox toolbar topic.

Adding controls to report

All controls types are available for placement on the report from the Toolbox toolbar. Simply click on a control type in the Toolbox. Move the cursor into the Report Design Surface. The cursor will turn into a crosshair (+) cursor. Click in the report section where the control will be placed. Drag the mouse to size the new control.

Control properties

When selecting a control on the report design surface, the Properties toolbox will automatically display the available properties for that section.

Refer to the Properties Toolbox for details on all properties available for each control

Moving controls

Controls may be moved within the report section that it currently exists in. To move a control, simply click on and drag the control to the new area within the same section. To move a control to another section, it must be cut from the existing section and then pasted into the new section.

Reorder controls

Controls placed on the report design surface may be layered (placed on top of each other) to produce a specific effect. For example, a textbox may be placed on top of a picture control or shape control as a label on the image or shape. There may be times when the layering order of controls must be changed. This is possible using the **Bring to Front** and **Send to Back** menu selections.

To reorder a control, right-click on a control and select either **Bring to Front** or **Send to Back** menu item from the shortcut menu.

Bring to front

Brings the selected control in front of all other controls within the report section. If there are no layered controls, this menu selection will have no visible effect on the controls in the report section.

Send to back

Sends the selected control to the back of all other controls within the report section. If there are no layered controls, this menu selection will have no visible effect on the controls in the report section.

Control border

Controls placed on the report design surface may have a border painted around the outside of the control. Right-click on the control and select the **Format Border** menu items from the shortcut menu. The Format Border dialog will be displayed.

Presets

Select the border type you want to use by clicking on an icon in the Presets section of the dialog. The selected setting is previewed in the preview section of the dialog.

	No border is applied.
	Applies a border to the bottom of the selected item.
	Applies a left border to the top of the selected item.
	Applies a right border to the top of the selected item.
	Applies a top border to the top of the selected item.
	Applies a border around the outside of the selected item.

	Applies a double border to the bottom of the selected item.
	Applies a thick border to the bottom of the selected item.
	Applies a border to the top and bottom of the selected item.
	Applies a border to the top and a double border to the bottom of the selected item.
	Applies a border to the top and a thick border to the bottom of the selected item.
	Applies a thick border around the outside of the selected item.

Line styles

Select the border style. Select from None, Solid, Dash, Dot, DashDot, Double, ThickSolid, ThickDash, ThickDot, ThickDashDot, ThickDashDotDot, ThickDouble, and ExtraThickSolid. The selected border is previewed on the right.

Color

Select the border color. Click to select a standard color or click the color box to select another color. The selected color is previewed on the right.

Preview

Displays the selected border.

Report design environment

(1)		Menu bar	The menu bar provides pull-down menus that open, save and print reports, add controls and report sections, format controls, and several options to customize the report design area. Most of these menu items are also available in their respective part of the report design area.
			Some selections on the menu bar may be unavailable (disabled) depending on the currently selected report section or control in the report design area.

(2)	Design	The design tab is where most of the work is done when creating a report. The design tab provides access to all design elements including toolbars and toolboxes.
(3)	Generate	The Generate tab is where the report is run against data. If the report uses parameters, the user will be prompted for the parameters when the Generate tab is selected.
(4)	Standard Toolbar	The Standard Toolbar contains buttons for commonly used operations from the File and Edit menus. This includes buttons for New Report, Open Report, Save Report, Save As Report, Undo, Cut, Copy, Paste, Delete, Reorder Groups.
(5)	Format Toolbar	The Format Toolbar contains buttons for commonly used operations to change the appearance of the selected controls. Commonly used Format options include, Bold, Italics, Underline, Font Settings, Align Left, Align Center, Align Right, Bullets, Decrease Indent, Increase Indent, Background Color, Foreground Color, Line Color, Line Style, Format Border, Font Style, Font Typeface and Font Size.
(6)	Alignment Toolbar	The Alignment Toolbar contains buttons for commonly used operations from the Format menu. This includes Bring to Front, Send to Back, Align Lefts, Align Centers, Align Rights, Align Tops, Align Middles, Align Bottoms, Align to Grid, Same Size Width, Same Size Height, Same Size Height and Width, Decrease Horizontal Space, Set Horizontal Space Equal, Increase Horizontal Space, Decrease Vertical Space, Set Vertical Space Equal, Increase Vertical Space and Lock.
(7)	Toolbox Toolbar	The Toolbox Toolbar contains buttons for the controls that can be used to display information on the report. The controls can also be selected from the Insert menu. The control types include: Pointer, Label, Textbox, Checkbox, Picture, Shape, Line, Rich Textbox, Subreport, Page Break, Barcode and Chart.
(8)	Report Design Interface	The Design interface is where most of the work is done when creating a report. The design area designates the various sections of the report and displays the fields that are contained within each section.
(9)	SQL Interface	The SQL Interface is where pre-defined SQL statements can be selected and/or modified. SQL statements can be created or modified by pressing the SQL button.
(10)	Field Explorer Toolbox	The Field Explorer Toolbox shows the database fields available for use in the reporting interface. The list of fields is built based on the SQL statement defined in the report.
(11)	Report Explorer Toolbox	This Report Explorer Toolbox is a helpful tool which provides easy navigation through the report's elements. This includes each report band and all of its controls. It also provides a simple way to modify each report element's properties in the Properties Toolbox.
(12)	Properties Toolbox	The Properties Toolbox is used to change the properties of all report elements, including bands and controls.

Generate report

When a report is executed, the **Generate** tab within the Report Design Interface is selected. If the report contains runtime parameters, the user will be asked to enter values for the parameters. Once the parameter values are entered, click **OK** and the results of the report are presented.
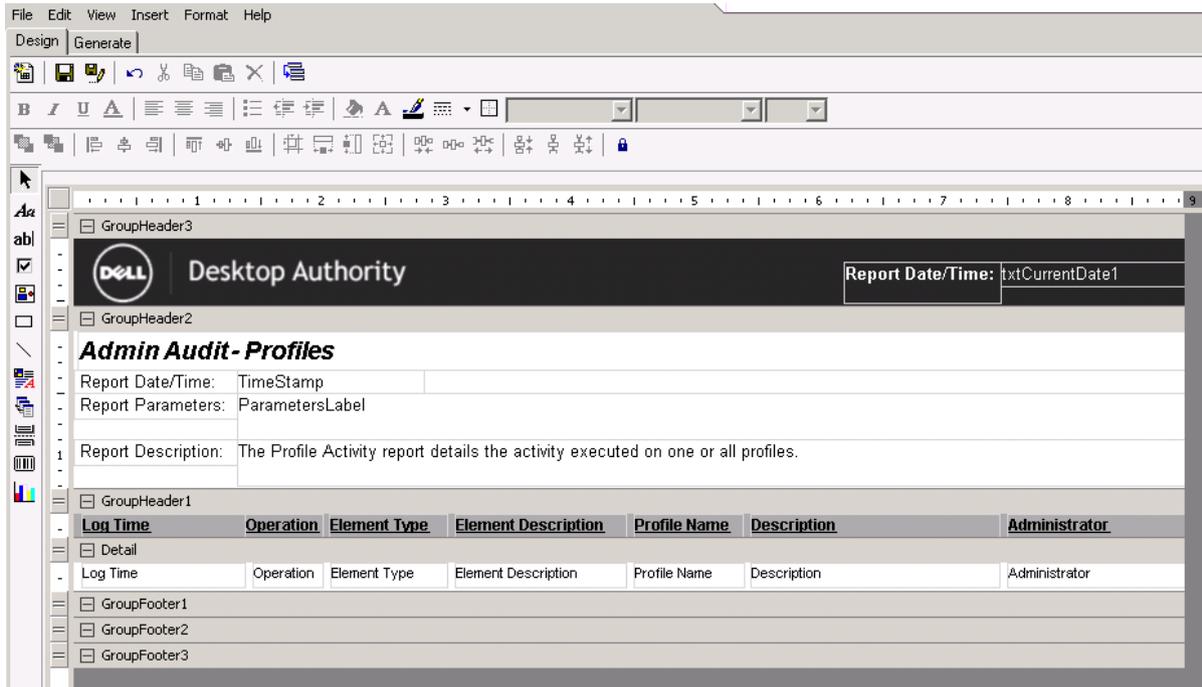

Toolbar

The toolbar on the Generate tab allows the user to view the generated report's pages.

Icon	Description

Forward	Jump forward to last page viewed
Scheduled reports

Desktop Authority's Report Scheduler dialog displays a list of the reports scheduled, their scheduled date and time, and the recurrence of the schedule. Scheduled Reports can recur by running once, daily, weekly, monthly, or end of month. The scheduler can automatically e-mail reports once the report is complete.
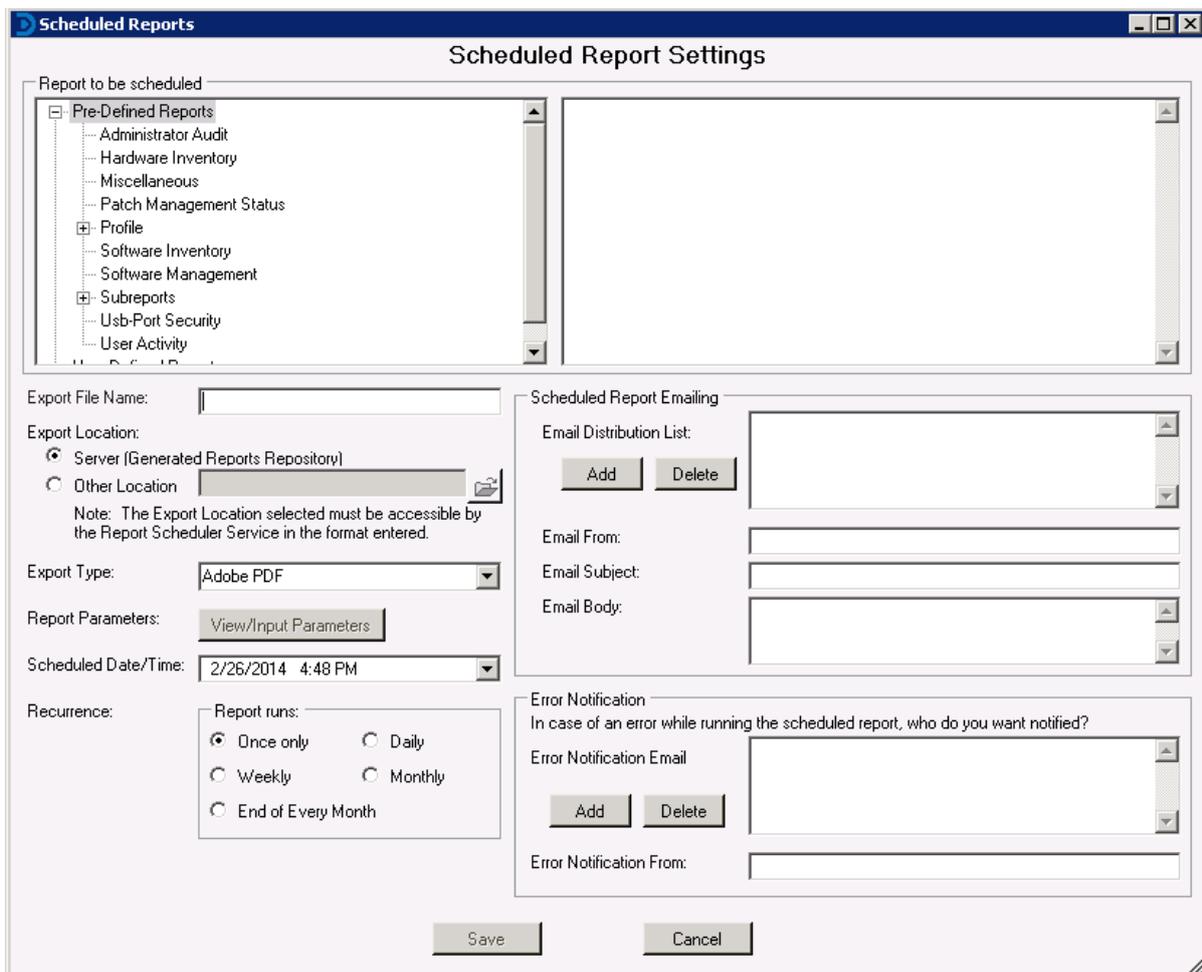

Scheduled report settings

Report to be scheduled

Select a Report category and then the report from the report list.

Export file name

Specify the name of the final report output file. The current date/time will be appended to the end of the file name.

Ex. ThisScheduledReport (5-15-2005 12 45 16).pdf

Export location

Select **Server** to generate the scheduled report into the default reports repository (\Desktop Authority Manager\Repositories). Select **Other Location** in order to specify some other location to save the report to.

Export type

Select the type of report to create. Reports can be exported to HTML, Adobe PDF, Word/Rich Text Format, Text, Tiff, Excel and Active Report RDF.

Report parameters

If the selected report uses runtime parameters, click **View/Input Parameters** to set the default runtime values. The first column in the list contains the runtime field name and the second column contains the value of the parameter.

When upgrading Desktop Authority or importing reports from an updated SLI file, parameters from all scheduled reports will become null and void. These parameters must be re-entered for the scheduled report before the report can be successfully executed.

Scheduled date/time

Select the Date and Time for the report to be run. For recurring reports this will be the starting Date and Time. Click [▼] to select a date.

Recurrence

Reports can be scheduled to run one or more times based on a recurring basis. Select from **Once**, **Daily**, **Weekly**, **Monthly** or **End of Every Month**. Only one recurrence period can be selected per scheduled report.

Scheduled Report Emailing

Email distribution list

The Email Distribution List contains all email addresses to which the report output will be delivered. If the report results in an error, no report will be sent to this distribution list. Click **Add** to add an email address to the list. Click **Delete** to remove the selected email address from the list.

Email from

Enter the source of where the email is coming from. Usually this will be the senders email address.

Email subject

Enter the subject of the email that will be used to distribute the report.

Email Body

Enter the text to appear in the body of the email that will be used to distribute the report.

Error notification

Error notification email distribution list

If an error occurs in a report, an email will be sent to all email addresses in the Error Notification Email Distribution List. A report will also be generated showing the error message. This error report will be saved to the Generated (Saved) Reports repository.

Click **Add** to add an email address to the list. Click **Delete** to remove an email address from the list.

Error notification from

Enter the email address from whom the Error Notification Email will come.

When saving a scheduled report it will be saved to the User-Defined Report Repository.

SQL reporting wizard

The SQL Reporting Wizard is used to create User-Defined reports using a wizard style interface. The wizard will automatically populate selected fields to the report layout and generate the necessary SQL statement including sorting and filtering the data. No need to know SQL, the wizard will write it all for you! The wizard can create reports for the Software Inventory, Hardware Inventory, and Administrator Audit categories.

What kind of report do you want to create?

Select your report category from the **Welcome to the Report Wizard**. Choose from Software Inventory, Hardware Inventory, and Administrator Audit.

Click **Next** to continue. Click **Cancel** to quit the Wizard.

What items do you want to include in your report?
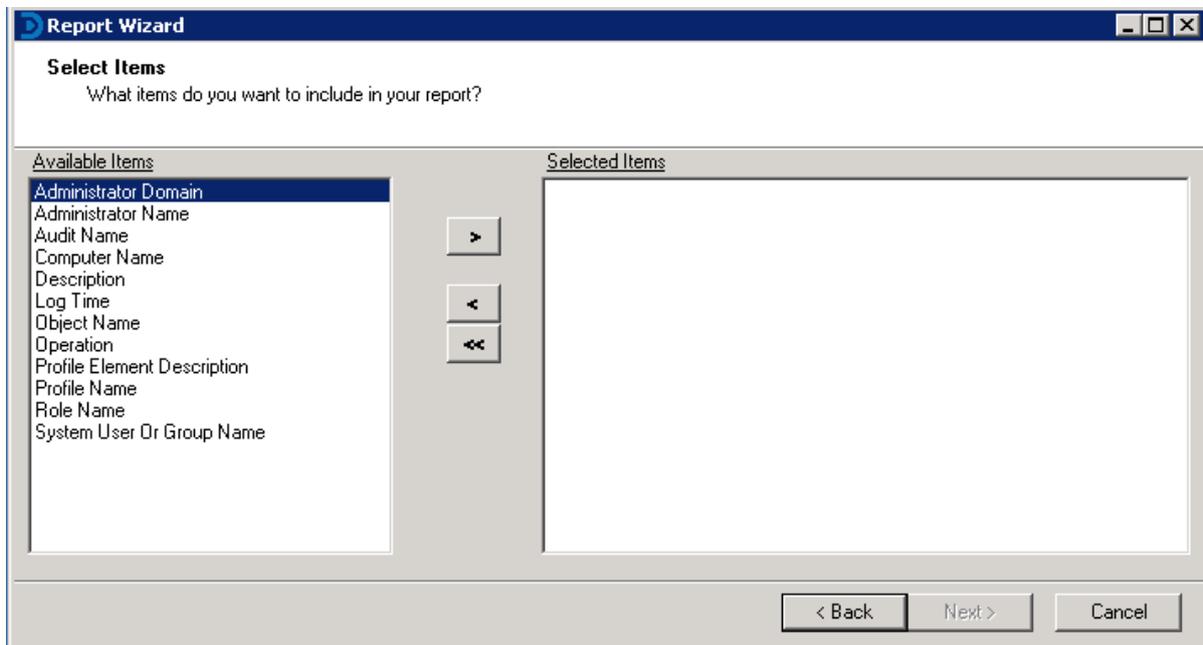

Based on your report category selection, this page of the wizard will present all of the items that correspond to the type of report to be built. Select the items that you want to appear on your report by first, highlighting the field

and then click [>]. Click [<] to remove a previously selected item from the list.

Click **Next** to continue. Click **Cancel** to quit the Wizard.

Do you want to group any items into group header sections?
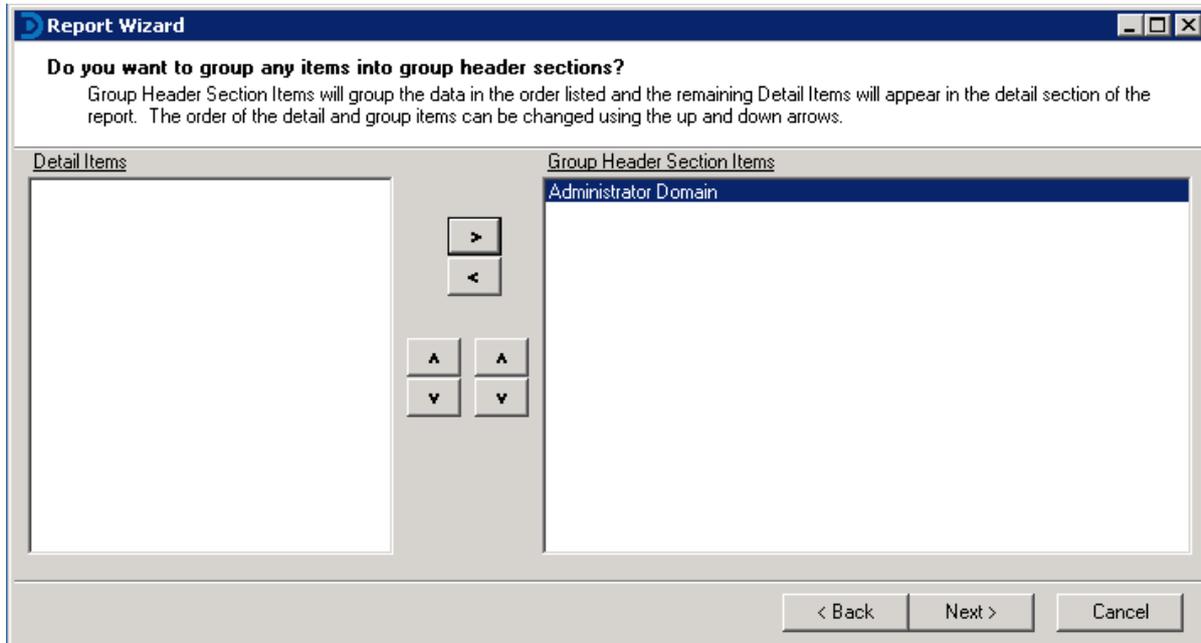

From the items selected for the report detail, optionally select one or more to represent a group header for the report. The group header section is printed immediately before the detail section and contains the items selected for the group header. Each time the group header data changes a new group header is printed. Creating a group header will sort the report data by the group header items. All other items will remain in the detail portion of the report.

Select the items that you want to appear in your group header by first, highlighting the field, and then clicking [>]. Click [<] to remove a previously selected item from the list.

Click **Next** to continue. Click **Cancel** to quit the Wizard.

Do you want to sort any detail items?

This page provides the ability to sort the report detail section. Select the items that you want to appear in your group header by first, highlighting the field and then click ____. Click ____ to remove a previously selected item from the list. Select Ascending or Descending sort order from the Sort Direction list.

Click **Next** to continue. Click **Cancel** to quit the Wizard.

Do you want to add a filter to the report?

Adding a Filter to a report will restrict certain data from appearing on the report. This will generate the "WHERE" clause of the SQL statement. Click Add New Filter to begin the filter definition.

For each column, click the down arrow to select the appropriate field or condition for the filter. Available conditions are [Does, Does Not, Is, Is Not] [Contain, Start With, End With, Between, Equal To, Less Than, Less Than or Equal To, Greater Than, and Greater Than or Equal To].

Select the Prompt User box to allow the user to supply the Value(s) for the report when it is run. Click [X] to remove the selected filter.

How do you want to describe the report?

What title do you want for the report?

Enter the title of the report. This will appear in the reports Page Header.

What do you want to name the report?

Enter the name of the report as it will be shown in the list of User-Defined reports.

Report orientation

Select either Landscape or Portrait report orientation.

Save the report

At this point all of the report design specifications have been selected and designed. The report will now be saved to the User-Defined report repository.

Save and generate report

Select this option to save the report and execute it.

Save and go to design

Select this option to save the report and load the report for further design modifications.

Save and schedule report

Select this option to save the report and then schedule it.

Click **Finish** to complete the SQL Reporting Wizard.

Report interface alignment toolbar

The Alignment toolbar icons are available to format the alignment and layering of controls on the report design surface. The toolbar icons are available for use only when one or more controls are selected.

Icon	Action	Description
	Bring to Front	Moves the selected control in front of all other controls in the band.
	Send to Back	Moves the selected control behind all other controls in the band.
	Align Lefts	Aligns the selected group of controls with the leftmost position of the control that was selected last.
	Align Centers	Centers the selected group of controls based on the horizontal center of the control that was selected last.
	Align Rights	Aligns the selected group of controls with the rightmost position of the control that was selected last.
	Align Tops	Aligns the selected group of controls with the topmost position of the control that was selected last.
	Align Middles	Aligns the selected group of controls based on the vertical center of the control that was selected last.
	Align Bottoms	Aligns the selected group of controls with the bottommost position of the control that was selected last.
	Align to Grid	Moves selected controls to line up with the report grid.
	Same Size Width	Makes the selected controls the same width based on the control that was selected last.

Icon	Action	Description
	Same Size Height	Makes the selected controls the same height based on the control that was selected last.
	Same Size Height and Width	Makes the selected controls the same height and width based on the control that was selected last.
	Decrease Horizontal Space	Decreases the horizontal separation between three or more selected controls.
	Set Horizontal Space Equal	Moves the selected controls so there is an equal horizontal distance between them.
	Increase Horizontal Space	Increases the horizontal separation between three or more selected controls.
	Decrease Vertical Space	Decreases the vertical separation between three or more selected controls.
	Set Vertical Space Equal	Moves the selected controls so there is an equal vertical distance between them.
	Increase Vertical Space	Increases the vertical separation between three or more selected controls.
	Lock	Locks the position and size of all controls on the report.

Report interface field explorer toolbox

The Field Explorer toolbox is a pane on the report design surface which displays a list of data source fields. The fields defined in the Fields list is determined by the SQL statement designed for the report.

Fields
Computer ID
Machine Name
Software Publisher
Software Display Name
Software Display Version
Software Install Date
Software Install Location
Software Install Source
Software Last Updated

Report interface format toolbar

The Format toolbar icons are available to format the look and style of controls on the report design surface. The toolbar icons are available for use only when one or more controls are selected.

Icon	Action	Description
B	Bold	Set bold typeface on or off
I	Italics	Set italic typeface on or off
U	Underline	Set underline typeface on or off
A	Font Settings	Open the Font Settings dialog
	Align Left	Align text left in the control area
	Align Center	Align text centered in the control area
	Align Right	Align text right in the control area
	Bullets	Add bullets to the text in the RichText control area
	Decrease Indent	Decrease the indent of the text in the RichText control area
	Increase Indent	Increase the indent of the text in the RichText control area
	Background Color	Set the background color
A	Foreground Color	Set the foreground color

Icon	Action	Description
	Line Color	Sets the color of the line
	Line Style	Set the style of the line
	Format Border	Open the Format Border dialog
Normal	Style	Set the style sheet for a control
Arial	Font	Set the typeface of the selected label, checkbox or textbox control
10	Size	Set the font size of the selected label, checkbox or textbox control

Report interface menu bar

The menu bar provides pull-down menus that open, save and print reports, add controls and report sections, format controls, and several options to customize the report design area. Most of these menu items are also available in their respective part of the report design area.

Some selections on the menu bar may be unavailable (disabled) depending on the currently selected report section or control in the report design area.

Menu	Description
File	Use the File menu to create, open, save and print reports. You can also set the report properties as well as export a report. Use the Update Reporting Database selection to move all audit data to the reporting database so it can be used in reports.
Edit	This menu includes items for *Undo*, *Cut*, *Copy*, Copy Page, *Paste*, *Delete, Delete Section, Find, Reorder Groups* and Properties.
View	The View menu provides items to modify the look of the report design area. The Properties List, Fields List, Grid, Toolbars and Ruler can all be toggled here. There is also menu selected to choose between the design view and report preview.
Insert	The Insert menu provides selections to add new report sections (Report Header/Footer, Page Header/Footer, and Group Header/Footer) and new controls to the report.
Format	The Format menu provides menu selections for align, size, space, reorder and lock controls within the report design area.
Help	The Help menu displays information about the Reporting Tool.

Report explorer toolbox

The Report Contents toolbox provides a simple way to navigate to a certain section and/or control on the report. By clicking on a section or control in the Report Contents toolbox, it will automatically be selected on the report design surface.
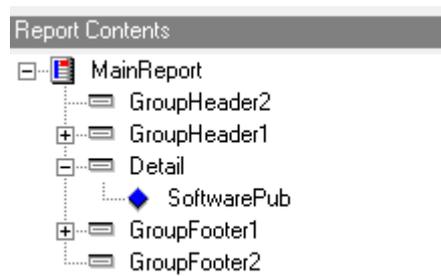

After selecting a report section or control from the Report Contents toolbox (or on the report design surface), the Properties toolbox will display the actual properties for the selected section or control.

Report SQL interface

The Desktop Authority Reporting Tool provides several pre-made SQL statements for use in reports. These pre-made SQL statements are made available to provide a jump start for most reports. Click **View/Edit SQL Query** from the report design surface to create a new SQL query, select a pre-defined query or modify an existing query.
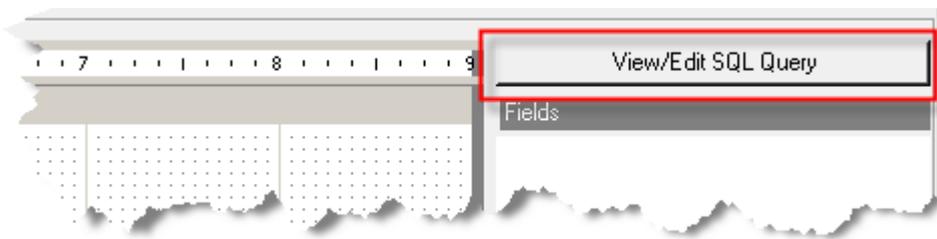

Select a pre-made SQL statement from the SQL drop down list, enter a new SQL statement or modify an existing statement by typing into the textbox.
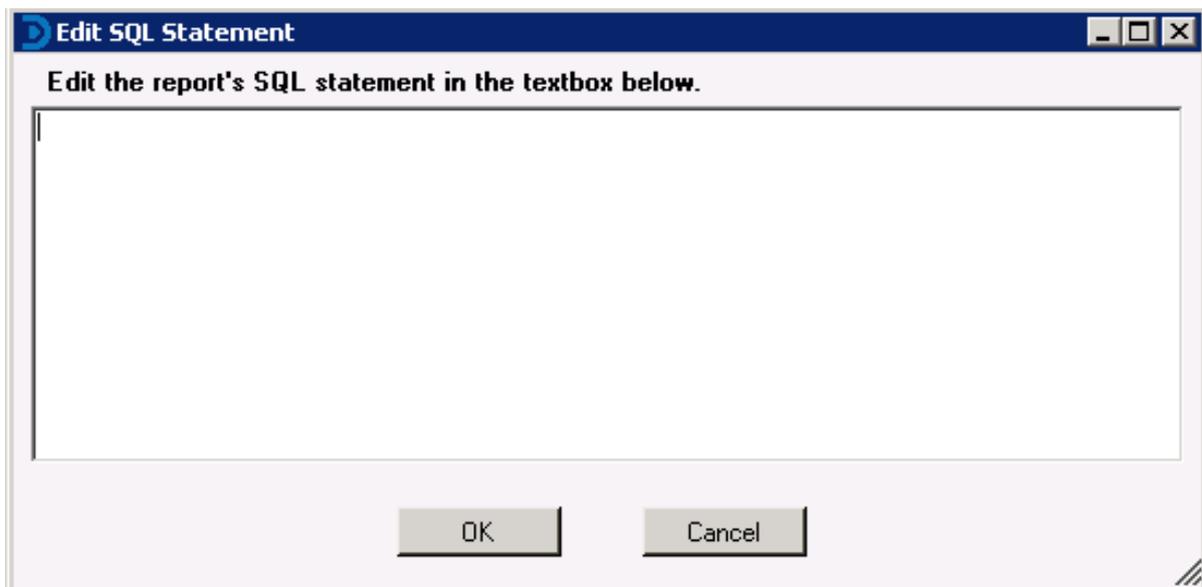

Note: When creating an SQL statement, always start your statement with "SELECT", "SELECT DISTINCT", or "IF NOT EXISTS" in order to ensure optimal performance in the Report Designer. If the SQL statement does not start in this way you may notice a lag time when loading a report in the Report Designer or when switching between the Report Designer and Generate Reports.

Report interface standard toolbar

The Standard toolbar icons are available to for general report actions such as creating, opening and saving reports.

Icon	Action	Description
	New Report	Create a new report
	Open Report	Open an existing report
	Save Report	Save report
	Save As Report	Save report with a new name
	Undo	Undo last action
	Cut	Cut selected control
	Copy	Copy selected control to clipboard
	Paste	Paste control from clipboard
	Delete	Delete selected control
	Reorder Groups	Change the order of report groupings

Report interface toolbox toolbar

The Toolbox toolbar contains icons that represent the type of control to place on the report design surface.

Icon	Action	Description
	Pointer	Select controls or sections of the report
	Label	Prints static text on the report.
	Textbox	Prints a formatted text value
	Checkbox	Checkbox is used to print Boolean values as checked or unchecked.
	Picture	Prints an image on the report.
	Shape	Prints a rectangular or oval shape on the report.
	Line	Prints a line on the report.
	Rich Textbox	Prints text formatted as Rich Text (RTF) on the report.
	SubReport	Prints a linked report object as part of the current report.
	Page Break	PageBreak ends the current page and starts a new page at the control's location on the page.
	Barcode	The Barcode control is used to print barcode symbology in the report.
	Charting	Renders a chart on the report. The Chart control supports many different types of charts. The supported chart types are Area, Area 3D, Bar, Bar 3D, Clustered Bar, Bezier, Doughnut/Pie, Doughnut/Pie 3D, Line, Line 3D, Scatter, Stacked Area, Stacked

Icon	Action	Description
		Bar, Stacked Bar 3D, Stacked Area 100 Pct., Stacked Bar 100 Pct., Stacked Bar 3D 100 Pct., Bubble, BubbleXY, LineXY, PlotXY, Candle, HiLo, and HiLoOpenClose.

Reporting Tips and Techniques

Report header/footer

A report can have a single report header section and report footer section that prints at the very beginning and end of each report. The Report Header section is normally used to print a report title, a summary table, a chart or any information that needs only to appear once at the report's start.

The Report Footer prints at the end of the report. It is normally used to print a summary of the report, grand totals or any information that needs to print once at the report's end.

- Right-click in the report design surface, select Insert > Insert Report Header/Footer. This will insert a new Report Header/Footer section into the top and bottom areas of the report. Both a Report Header and a Page Footer will be created.

- To remove one of these report sections, set the Visible property to False. Be sure the correct section is selected before setting the property.

Page header/footer

A report can have a single page header section and page footer section that prints at the top and bottom of each page. The Page Header is the first section that prints on the page except when the page contains a Report Header section. The page header section is normally used to print column headers, page numbers, a page title or any information that needs to appear at the top of each page in the report.

The Page Footer prints at the bottom of each page. It is normally used to print page totals, page numbers or any other information that needs to appear at the bottom of each page.

- Right-click in the report design surface, select Insert > Insert Page Header/Footer. This will insert a new Page Header/Footer section into the top and bottom areas of the report. Both a Page Header and a Page Footer will be created.

- To remove one of these report sections, set the Visible property to False. Be sure the correct section is selected before setting the property.

Report parameters

Use parameters in reports to prompt the user for input as the report is being generated.

The parameter dialog is created based on the SQL statement the report is using.

Add **<%TableField:**[Table Name:] [Field Name:] [Category] **|** [User Prompt|] [Default Value|] [Variable Type]**%>**

to the WHERE or ORDER BY clause of the SQL string for the report to display the Parameters dialog.

Table Name is the name of the table to be used to fill the parameter field with data for selection by the user. This is optional and should only be used when the report parameter field is to be pre-populated with data. A colon (:) must follow the Table Name if this parameter is used.

Field Name is the name of the data field you wish to request from the user as well as the name of the field to pre-fill the parameter drop list with. This is required when defining a report parameter. A colon (:) must follow the Field Name if this parameter is used.

Category Name is used to determine which data set to select data from. It should be filled with either *CBM* or *User*. The Category Name is an optional parameter. If this parameter is not specified, both Computer Management and User Management data will be queried.

User Prompt is an optional value which sets the text that is displayed to the user when report parameter data is requested.

Default Value sets a default value for the parameter. For example, if you have a date parameter, you can set the DefaultValue for the field to the current date so users can just hit ENTER unless they want to generate a report based on a different date.

Variable Type indicates the type of the data being requested. The possible values are: nothing (which defaults to string), S for string, D for date, and B for Boolean. A string type provides a textbox for input; a date type provides a calendar drop-down control for input; and a Boolean type provides a checkbox for input.

Example:

```
SELECT DISTINCT
dbo.HardwareInventory.ComputerIdentificationID 'Computer ID',
dbo.HardwareInventory.ComputerName 'Computer Name',
dbo.SoftwareInventory.Publisher 'Software Publisher',
dbo.SoftwareInventory.DisplayName 'Software Display Name',
dbo.SoftwareInventory.DisplayVersion 'Software Display Version',
dbo.SoftwareInventory.InstallDate 'Software Install Date',
dbo.SoftwareInventory.InstallLocation 'Software Install Location',
dbo.SoftwareInventory.InstallSource 'Software Install Source',
dbo.SoftwareInventory.LastUpdated 'Software Last Updated'
FROM
dbo.HardwareInventory
WHERE
dbo.HardwareInventory.ComputerName LIKE '<%TableField:HardwareInventory:ComputerName|Computer
Name: |%|S%>'
ORDER BY
dbo.HardwareInventory.ComputerName, DisplayName
```

The above example will prompt the user for two parameters, Computer Name and Order By. Notice that the Computer Name parameter is pre-filled with data from the HardwareInventory table.
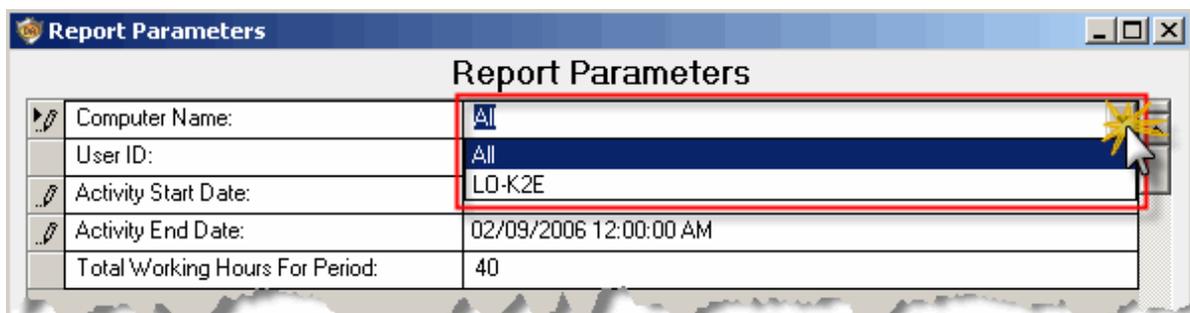

Report parameters can also be pre-populated with data for selection by the user with the use of a stored procedure. Use a report parameter field name beginning with Sproc. The parameter name starts with the word

Sproc, followed by the rest of the parameter name. For example, SprocUserGroup. Follow the stored procedure parameter name by a colon, then the name of the stored procedure.

Example:

<%SprocUserDomainGroups:UserDomainGroups|User Group: |%|S%>

The parameter name is SprocUserDomainGroups and the stored procedure that will be called is named UserDomainGroups.

If the stored procedure has parameters, they must be separated by colons and the stored procedure parameter name and parameter value must be separated by a pipe (|).

Example:

<%SprocUserDomainGroups:MySproc:@parameter1|value1:@parameter2|value2|User Group: |%|S%>

The parameter name is SprocUserDomainGroups and the store procedure that will be called is MySproc. The stored procedure has 2 parameters, value1 and value2.

Today's date

A report parameter may be defaulted to today's date as well as a number of days to or from today's date. To default a date parameter to the current date, the parameter name must start with DateToday. To set the default date x number of days before or after the current date, follow the DateToday parameter with a +X or -X where X is the number of days to add or subtract from the current date.

A parameter with the name of '<%DateToday-7|Activity Start Date: |12/24/2005|D%>' will show up as 11/24/2005 (given the current date of 12/1/2005) and '<%DateToday-0|Activity End Date: |12/31/2005|D%>' will show up as 12/1/2005 (given the current date of 12/1/2005). Notice that the report parameters default values are ignored when the DateToday parameter name is used.

Examples:

Control Type	Name Property
Label	DateToday
Label	DateToday+3
Label	DateToday-7

Displaying the report parameters on the report

A report's runtime parameters can be displayed on the report using a label control. Drag a label control onto the report design surface. Most often report parameters will be displayed on the report or page header section. The label's Name property must begin with "ParametersLabel". For example, ParametersLabel or ParametersLabel1 may be used as the label name.

For the Report Parameters example above, the following label control are added to the report design surface with the defined properties.

Control Type	Name Property
Label	ParametersLabel

All runtime parameters will be displayed at runtime within this control.

If a subreport uses parameters that are named exactly as the parent report's parameters, they name the sub reports' parameters, the parent report will pass the parameter values to the subreport.

GroupHeader/GroupFooter

To put a page number in either the group header or footer sections, place the following controls in the required section.

Control	Name	Text	Properties
Label	lblPage	Page	
Label	lblOf	Of	
Textbox	txtPageNumber	#	SummaryType = PageCount SummaryType = Group SummaryGroup = GroupSection
Textbox	txtPageCount	##	SummaryType = PageCount SummaryGroup = GroupSection

Note: The Names of the controls are arbitrary and can be named whatever is wanted.

Notice the Summary properties that are set for txtPageNumber and txtPageCount fields. The SummaryGroup property requires the name of the group header or footer section.
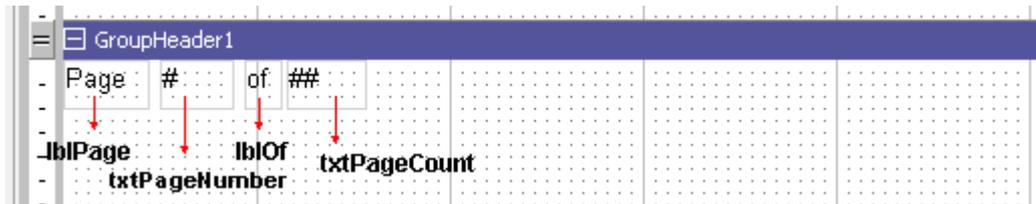

The above is how the fields will look on the report design surface.

PageHeader/PageFooter

To put a page number in either the group header or footer sections, place the following controls in the required section.

Control	Name	Text	Miscellaneous
Label	lblPage	Page	
Label	lblOf	Of	
Textbox	txtPageNumber	#	SummaryType = PageCount SummaryRunning = All
Textbox	txtPageCount	##	SummaryType = PageCount SummaryRunning = None

Notice the Summary properties that are set for txtPageNumber and txtPageCount fields. The SummaryGroup property does not need to be set in the case of a Page Header or Page Footer.
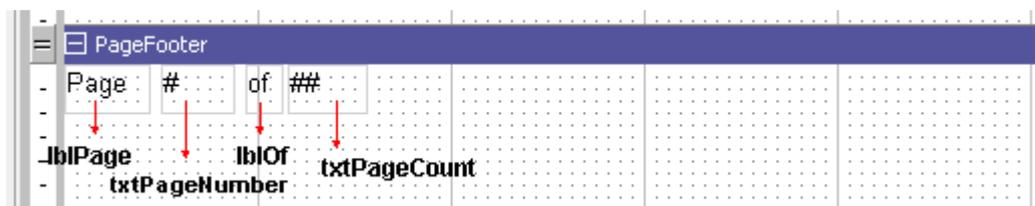

The above is how the fields will look on the report design surface.

Report date/time

The date and time the report is run can be displayed on the report, using a textbox control. Drag a textbox control onto the report design surface. Most often the report date/time stamp will be displayed on the report header section. The textbox's Name property must begin with "TimeStamp". Format the date/time stamp using the OutputFormat property.

For the Date/time stamp example above, the following textbox control are added to the report design surface with the defined properties.

Control	Name	Property
Textbox	TimeStamp	OutputFormat = M/d/yyyy h:mm tt

Charts

When adding a chart control to the report design surface, the chart wizard will automatically pop up. The chart wizard will allow the customization of the chart type, appearance, series, titles, axes, and the legend.

Select from 2D chart types:

Area	Doughnut	Stacked Area	Stock open only
Bar	HiLo	Stacked Area 100%	
Bezier	Line	Stacked Bar	
Bubble	Line XY	Stacked Bar 100%	
Bubble XY	Plot XY	Stock	
Candle stick	Scatter	Stock close only	

or 3D chart types:

Area	Line	Stacked Area 100%
Bar	Pie	Stacked Bar
Clustered Bar	Pyramid	Stacked Bar 100%
Cylinder	Ring	
Doughnut	Stacked Area	
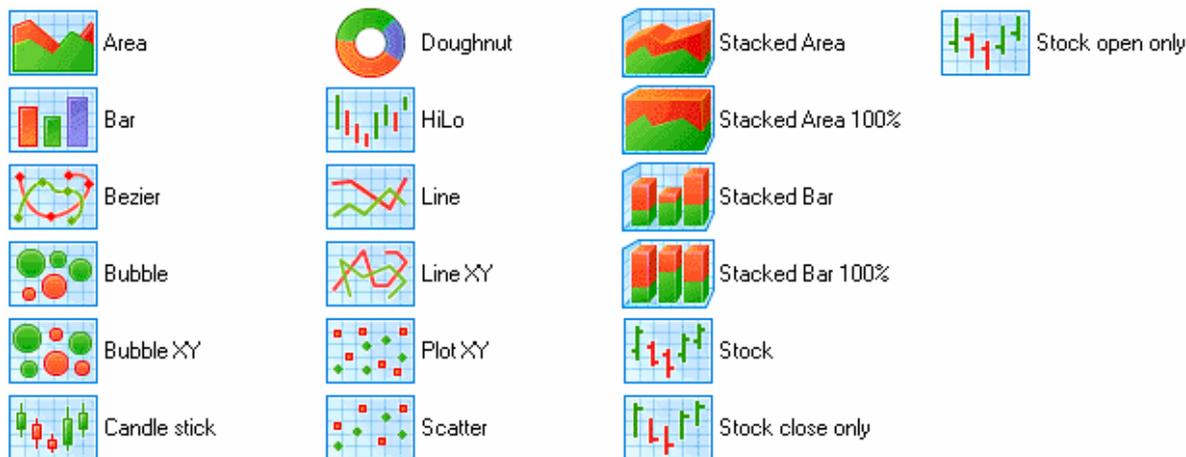

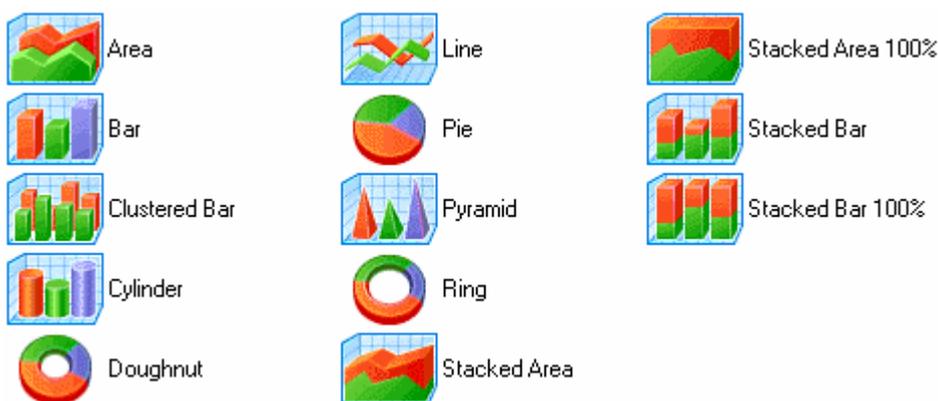

The following pages of the wizard allow the customization of the chart's appearance, color, titles etc. Press Finish to complete the customization of the chart. Once this is done, the chart may be customized at any time by right-clicking on the chart and selecting Wizard... or Customize... from the shortcut menu.

Chart markers

Markers are used to show the value of the data series in a chart. The marker value can be displayed as a point, square, circle, triangle, inverted triangle, diamond, period or cross. It may be aligned to various sections of the chart as well as colors and formats.

To add markers to a chart first add the chart control to the report. Right click on the report and choose customize from the context menu. The Chart Designer will display. Select the Series menu. In the series section of the dialog, scroll down to the marker section. Clear the Use default box. Set the appropriate alignment, shape, size and format.
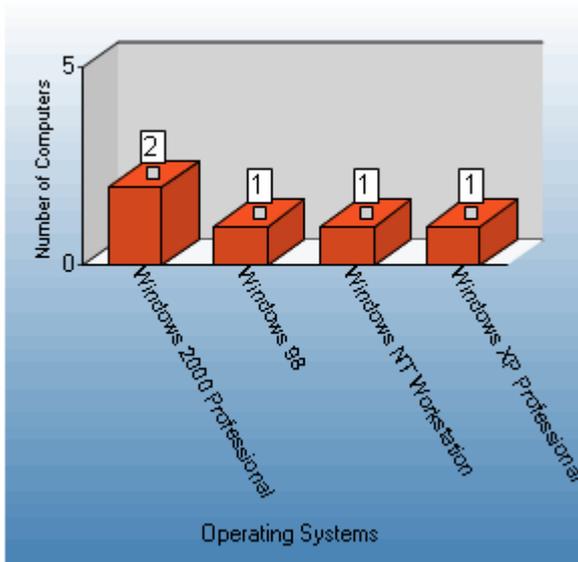

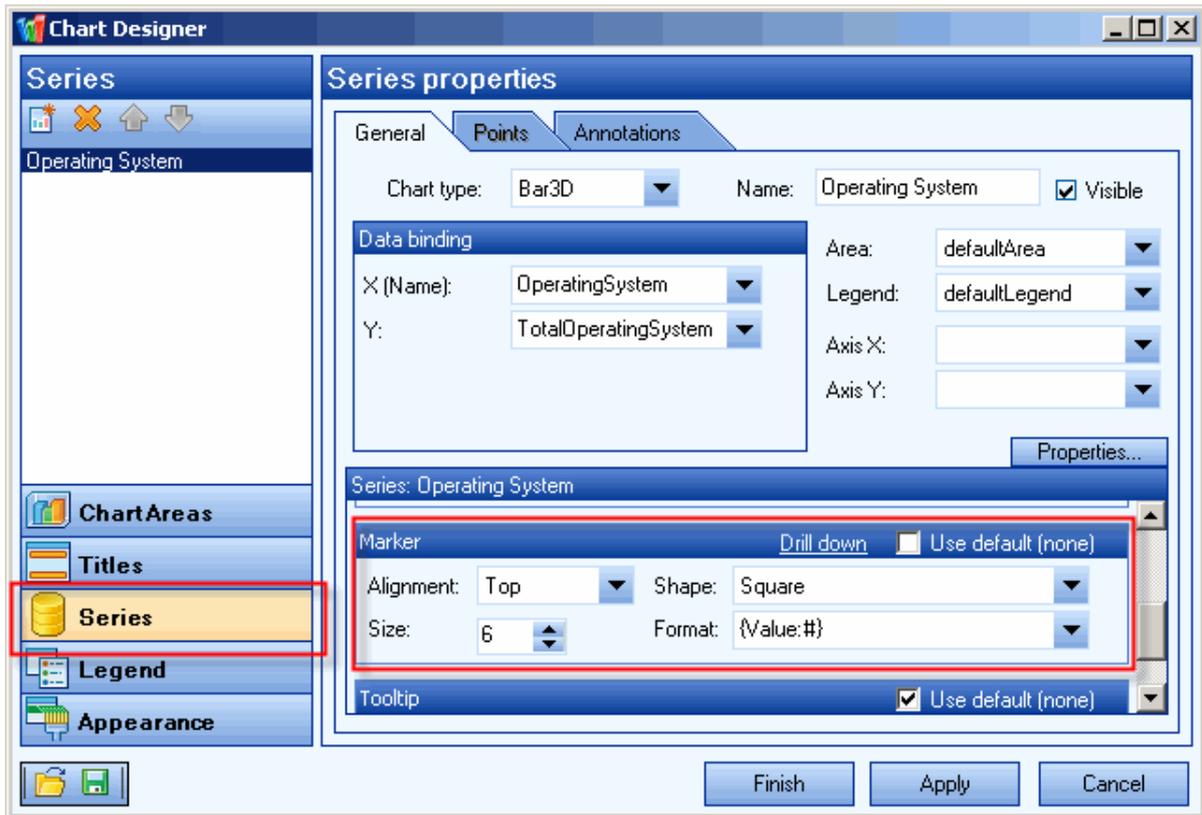

Subreports

Reports can contain any number of child reports by using the Subreport control. Child reports, or subreports, are executed each time the parent section (i.e. the section in which the Subreport control is placed) is printed.

Note: Subreports will not print PageHeader/Footer sections. These sections should be deleted on the Subreport to save on processing time.

The most important property to set when using a subreport control is the ReportName property in the data section. Set this to the exact name of the subreport. The size and position of the subreport control will determine how it get displayed at runtime. The DataField property on the subreport control can be set in order to send data to the subreport.

In the Desktop Authority pre-defined Desktop Hardware Inventory - Detailed report, there are several subreports. Let's look at one of them. The RAM (Bank Slot) section of the report contains a subreport control named SubReport1. This control's ReportName property is set to subRAM. Notice that the DataField property is set to Computer ID. What this does is calls the subRAM report and passes the value of the datafield, Computer ID, to the report.

The subreport subRAM uses the passed DataField value in the WHERE clause of its own SQL statement. It is represented as a parameter in the statement. See the Report Parameter section above for detailed information on coding the SQL statement for use with parameters.

WHERE
dbo.Hardware_SIMM.LastUpdated >= dbo.HardwareInventory.LastUpdated AND
dbo.HardwareInventory.ComputerIdentificationID = '<%Computer ID|Computer ID: |0|S%>'

The rest of the subreport is created just the same as any other report.

If a subreport uses parameters that are named exactly as the parent report parameters, they name the sub reports' parameters, the parent report will pass the parameter values to the subreport.

Summary fields

Summary fields can be added to any report section to calculate totals, counts, averages and other aggregations. Once the field is added to the report design surface the field's Summary properties can be set. The most common type of summary fields used in Desktop Authority reports are Counts and Sums. Find the steps for each type of summary field below.

Count

To Count the number of items in a group, place a textbox field in the desired group header or footer. Set the OutputFormat property to the proper format. The most important properties are the Summary properties. This is what makes the field count and reset its value. Set the following properties:

SummaryFunc = Count

SummaryGroup = ghHeader

This is the name of the Group Header or Footer where the data is to be counted and displayed.

SummaryRunning = Group

Set to Group to count at the group level. This will reset the count for each group. Setting this property to All will force the count to keep incrementing following each group.

SummaryType = Sub Total

Set to Sub Total to reset the count for each group. Set to Grand total to count at the report level. Set to Page total to reset the count for each page.

Sum

To Sum fields within a group, place a textbox field in the desired group header or footer. Set the OutputFormat property to the proper format. The most important properties are the Summary properties. This is what makes the field sum and reset its value. Set the following properties:

DataField = the name of the field to sum

SummaryFunc = Sum

SummaryGroup = ghHeader

This is the name of the Group Header or Footer where the data is to be summed and displayed.

SummaryRunning = Group

Set to Group to sum at the group level. This will reset the sum for each group. Setting this property to All will force the sum to keep incrementing following each group.

SummaryType = Sub Total

Set to Sub Total to reset the sum for each group. Set to Grand total to sum at the report level. Set to Page total to reset the sum for each page.

Calculated fields

In addition to Summary type fields, calculated fields can also be used in any report section. A calculated field is a field that performs calculations based on the value of specific data fields.

Using textbox controls, add the data fields to the report design surface. Set the calculation in the DataField property of the textbox control. All calculated fields will begin with an equal sign (=).

Ex. = [datafield1] + [datafield2]

Report properties

The report properties dialog provides a way to control the reports page setup, report printer settings, font styles and report global settings.

Page setup
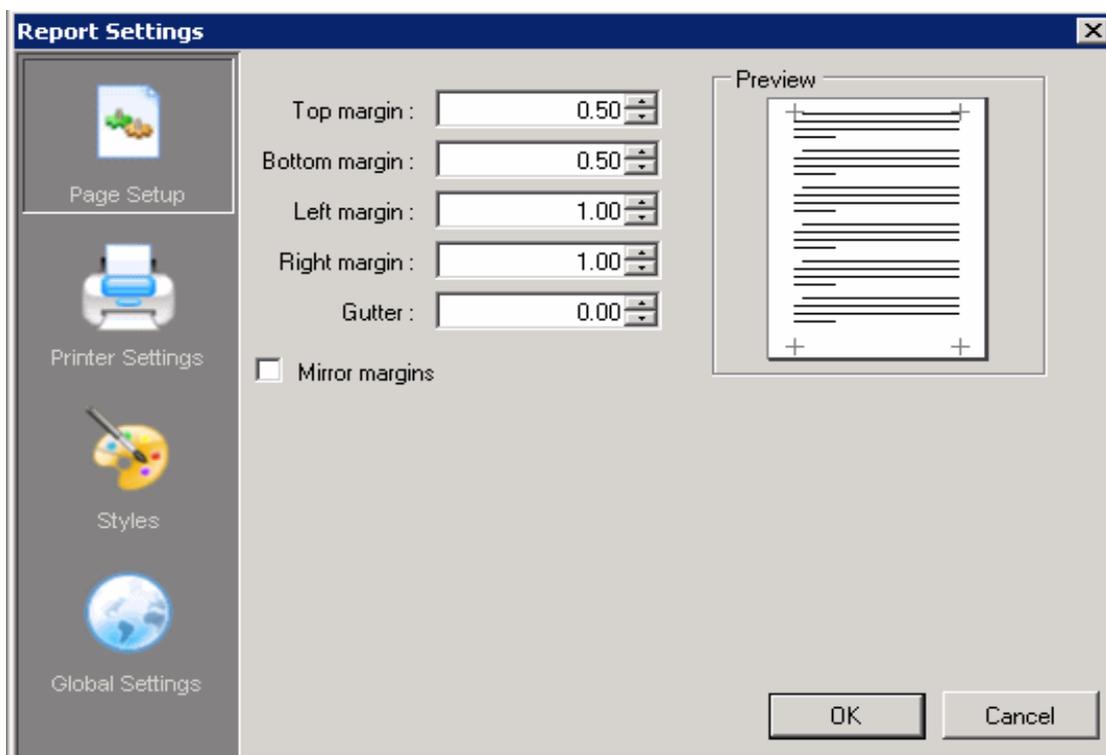

Top margin

Sets the top margin value in inches.

Bottom margin

Sets the bottom margin value in inches.

Left margin

Sets the left margin value in inches.

Right margin

Sets the right margin value in inches.

Gutter

Sets the amount of space between columns in inches. Specifying a gutter gives extra space between the edge of the page and the margins. This allows reports to be bound.

Mirror margins

Check this box to set the inner margins in the report in a way that opposite pages have the same width and the outside margins for opposite pages have the same width.

Printer settings
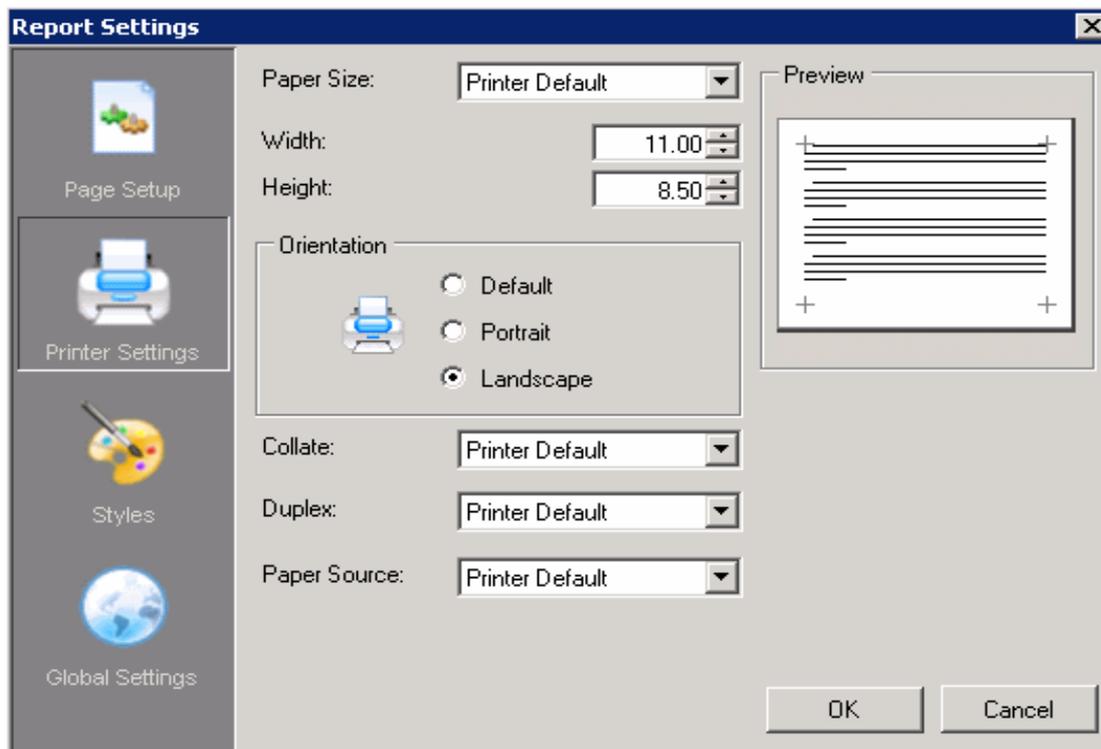

Paper size

Select a paper size from the list. Several paper sizes are available. If the necessary paper size is not available in the list, choose Custom paper. When this is selected, enter in a paper height and width (in inches) in the respectable fields below the paper size selection box.

Width

Enter a custom size paper width in inches.

Height

Enter a custom size paper height in inches.

Orientation

Select the Orientation in which to print the report. Select from Default, Portrait or Landscape. Default will use the printers default setting.

Collate

Select the Collation mode for the report. Choose from Printer Default, Collate or Don't Collate. Collate will print a complete copy of the report before the first page of the next copy is printed. Don't Collate will print each page by the number of copies specified before printing the next page. Printer Default will use the printer's collate setting.

Duplex

Select the Duplex mode for the report. Duplexing allows the report to be printed double-sided. Select Duplex to print the report double-sided. Select Simplex to turn off duplex printing. Select Horizontal to print horizontally on both sides of the paper. Select Vertical to print vertically on both sides of the paper. Select Printer Default to print the report use the printer's duplex setting.

Paper Source

Select the paper source for the report. Printer Default will print the report using the printers default paper source.

Styles
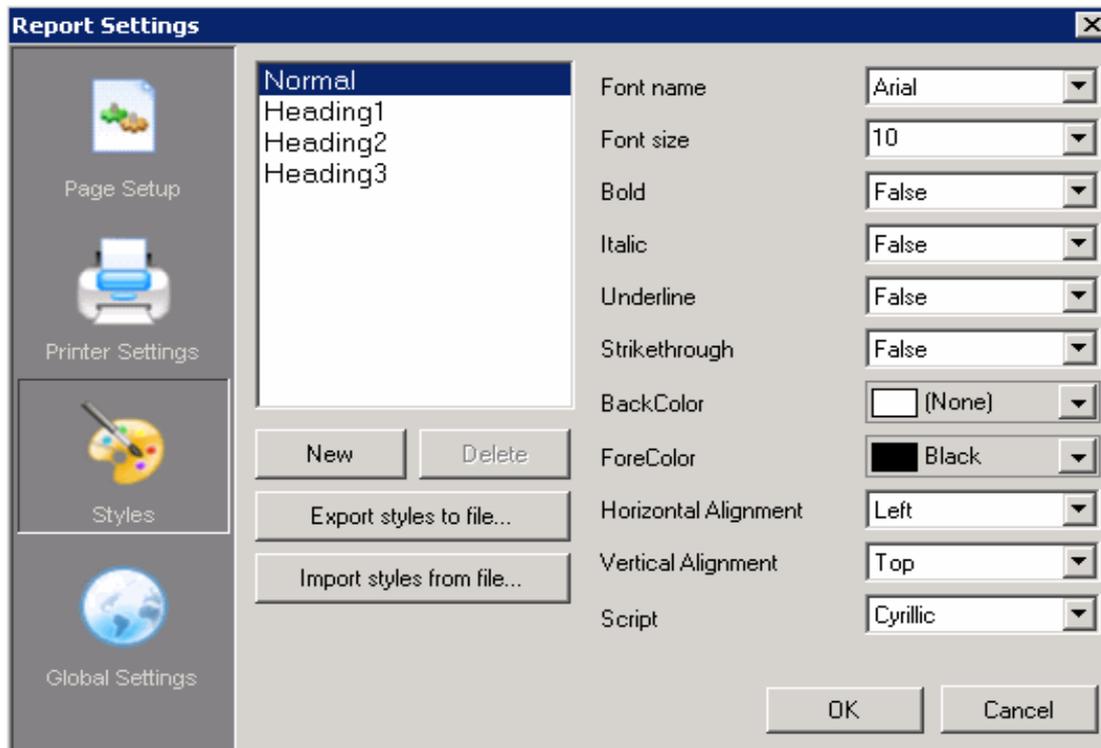

The styles dialog is used to create style sheet settings that can be used within the report design. Once styles are created, they can be used to easily and consistently modify the appearance of text associated controls within the report. A style is applied to a control via the Style property for the control.

The Style list displays all styles that have already been created. To the right of the list, the properties associated with the style are displayed.

Click New to create a new style. Select a style and click Delete to remove a style.

Global settings
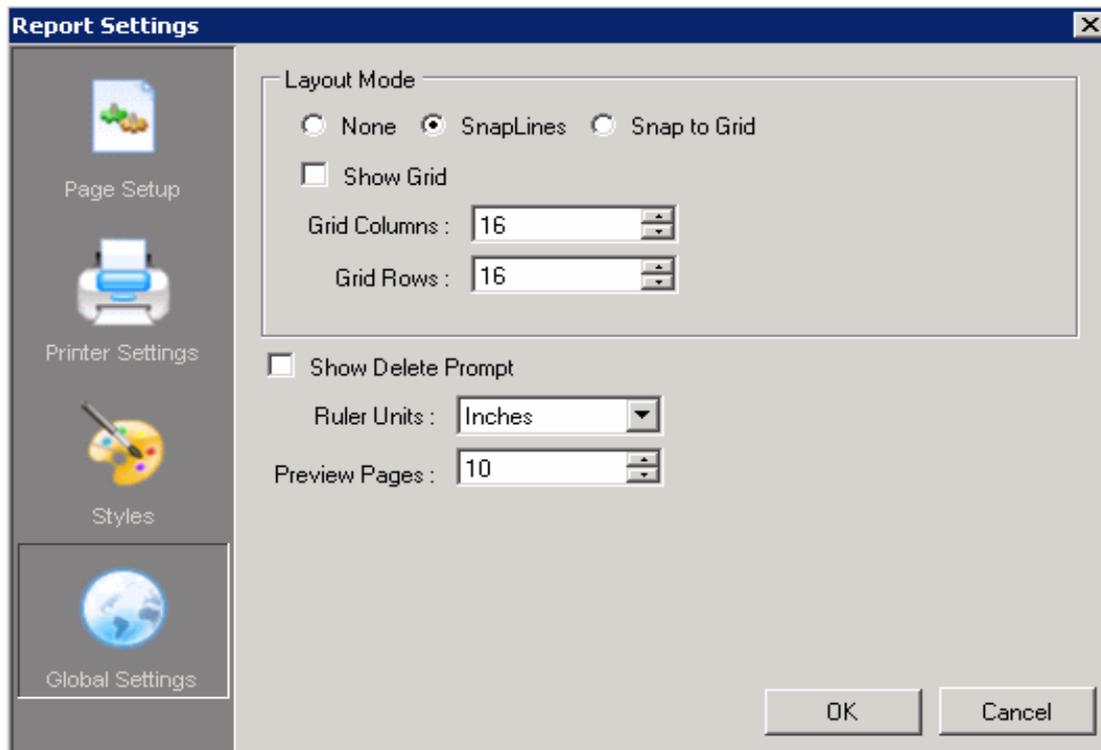

Show grid

Select this box to display the grid in the design surface of the report. Clear this box to hide the grid in the design surface of the report.

Align controls to grid

Select this box for controls to automatically snap to the grid as they are added to or moved within the report design area; otherwise clear this box.

Grid columns

Set the number of grid columns.

Grid rows

Set the number of grid rows.

Ruler units

Select the units of measurement for the ruler. Select from Inches or Centimeters.

Report interface properties toolbox

The Properties Toolbox is used to change the properties of all report elements, including report sections (bands) and controls. The following list defines the supported properties of each band/control.

Report bands

Band properties

	Report Header	Report Footer	Page Header	Page Footer	Group Header	Group Footer	Detail
(Name)	●	●	●	●	●	●	●
BackColor	●	●	●	●	●	●	●
CanGrow	●	●	●	●	●	●	●
CanShrink	●	●	●	●	●	●	●
ColumnCount							●
ColumnDirection							●
KeepGroupTogether					●		
ColumnLayout					●	●	
ColumnSpacing							●
DataField					●		
KeepGroupTogether					●		
Height	●	●	●	●	●	●	●
KeepTogether		●			●	●	●
NewColumn					●	●	●
NewPage	●	●			●	●	●
PrintAtBottom		●				●	
RepeatStyle					●		
UnderlayNext					●		
Visible	●	●	●	●	●	●	●

(Name)

Text to be used as the name of the report section.

Blackwood

Sets the color to be used as the background color of the report section. Use the drop list to select a color or enter in a color's Hex value.

CanGrow

Indicates whether the height of the section can grow if the controls within the section extend beyond the section's original height. Select True to allow the section height to grow. Select False to force the section height to remain the same regardless of the controls within it.

CanShrink

Indicates whether the height of the section should be adjusted to the exact total height of the controls within the section. Select True to allow the section height to adjust. Select False to force the section height to remain the same regardless of the controls within it.

ColumnCount

Sets the number of newspaper style columns for the detail section of the report.

ColumnDirection

Specifies the direction of the columns. Select DownAcross for the columns to print Top to Bottom, Left to Right. Select AcrossDown for the columns to print Left to Right, Top to Bottom.

ColumnGroupKeepTogether

Use this property is to prevent a group from splitting across columns. If the group will not fit in the current column, an attempt will be made by the report engine to render the full group in the next column. If the group is too large to fit in a single column, this property will be ignored.

This property will only be implemented when the GroupHeader's GroupKeepTogether property is set to All.

ColumnLayout

Set to True if the report section will have the same number of columns as its detail section. Set to False if the section will have a single column.

ColumnSpacing

Sets the size of the space between the specified number of columns.

DataField

Specifies the data field to be used for grouping. Changes in the value of the specified data field are monitored and a new group is started when the value changes. Current groups are ended (i.e. the group footer section is printed) before the new group is started.

GroupKeepTogether

Specifies whether a group header and footer pair with associated details will print as a single block on the same page.

None: A page can be broken immediately after a group header prints.

FirstDetail: The group header will print with at least the first detail section on the same page or column.

All: The group header, detail and group footer sections will print together on the same page.

Height

Sets the height of the selected report section.

KeepTogether

When this property is set to True, the report engine will attempt to print the section on the current page. If the contents do not fit on the current page and the current page is not a new page, the section will be moved to the next page. If the section does not fit on the following page, it will be moved back to the original position and the contents will be split across multiple pages.

When this property is set to False, the report engine will make no attempt to adjust the destination of the section currently being printed.

NewColumn

This property is used to determine whether a new column (in a columnar report) should be started before and/or after printing the section.

After: The report will break to a new column after each instance of the section.

Before: The report will break to a new column before each instance of the section.

BeforeAfter: The report will break to a new column before and after each instance of the section.

None: Sections will continue printing in the same column until they've run out of space.

NewPage

This property is used to determine whether a new page will be started before or after a section prints.

After: The report will break to a new page after each instance of the section.

Before: The report will break to a new page before each instance of the section.

BeforeAfter: The report will break to a new page before and after each instance of the section.

None: Sections will continue printing on the same page until they've run out of space.

PrintAtBottom

Set to True if the footer section will be printed at the bottom of the page; otherwise set this property to False.

Setting more than one group footer section in a report layout to print at the bottom of the page will cause subsequent group footer sections to print on separate pages.

RepeatStyle

Specifies whether the group header section will be repeated on subsequent detail pages within the same group.

None: The group header will not be repeated when the associated detail sections print on a new page.

OnPage: Repeat the group header section with every new page.

OnColumn: Repeat the group header section with every new column.

All: Repeat the group header section on every page or column.

OnPageIncludeNoDetail: Repeat the group header section on every page that includes an associated detail section or a group footer section. This setting prevents orphaned group footer sections.

UnderlayNext

Set this property to True for the following section to start rendering at the top of the current section; otherwise set to False.

Visible

Set this property to True to print the report section. Set this property to False to hide (not print) the report section.

Report controls

VerticalAlignment	●	●										

Alignment

Sets the alignment of the text within the control. Select from Left, Right, Center and Justify.

AnchorBottom

Anchors the line control to the bottom of the containing section. When set to True, this property will create a continuous line from line controls in adjacent sections.

AutoReplaceField

BlackAndWhiteMode

Specify whether the chart will be drawn in black and white using hatch patterns and line dashing to designate colors. Set to True to print the chart in Black and White. Set to False to print the chart in Color.

Backcolor

Sets the color to be used as the background color of the control. Use the drop list to select a color or enter in a color's Hex value.

Direction

Sets the barcode's direction, horizontally or vertically.

⊞Font

Sets the font information used to draw the control.

Name

Sets the Name of the font to be used in the control.

Size

Sets the size of the font used to render the control.

Unit

Sets the unit of the font (i.e. point, inch, etc.).

Bold

Sets the appearance of the defined font to bold.

GdiCharSet

Specify a byte value that sets the GDI character set that this Font set uses.

GdiVerticalFont

Specify whether the Font set is derived from a GDI vertical font. Set to True if it is derived from a GDI vertical font, otherwise False.

Italic

Sets the appearance of the defined font to italics.

Strikeout

Sets the appearance of the defined font to strikeout.

Underline

Sets the appearance of the defined font to underline.

Forecolor

Sets the foreground (font) color of the control.

IMEMode

Sets the Input Method Editor (IME) mode of the control. IME allows users to enter characters from other languages such as Chinese, Japanese, Korean, etc.

LineColor

Sets the color of a line control.

LineStyle

Sets the style of a line control.

LineWeight

Sets the weight (thickness) of a line control.

OutputFormat

Sets the display format of the data field. Formatting can only be used to format date, time, currency, and other numeric values. There is no support for formatting alphanumeric strings.

Times:

hh:mm tt = 09:00 AM

HH:mm = 21:00 (twenty-four hour clock)

HH = hours in 24 hour clock

hh = hours in 12 hour clock

mm = minutes

ss = seconds

tt = AM or PM

Dates:

dddd, MMMM d, yyyy = Saturday, December 25, 2004

dd/MM/yyyy = 25/12/2004

d or dd = day in number format

ddd = day in short string format (i.e. Sat for Saturday)

dddd = day in string format (i.e. Saturday)

MM = month in number format

MMM = month in short string format (i.e. Dec for December)

MMMM = month in string format (i.e. December)

y or yy = year in two digit format (i.e. 04 for 2004)

yyyy or yyyy = year in four digit format (i.e. 2004)

Currency and numbers:

$00.00 = $25.50

$#,#00.00 = $06.25

0 = digit or zero

= digit or nothing

% = percent-multiplies the string expression by 100

PictureAlignment

Determines the position of the picture within the control (TopLeft, TopRight, Center, BottomLeft, BottomRight).

RightToLeft

Used to allow the control to support text that should be printed right to left. Set to True to support right to left printing; otherwise set to False.

Style

Defines the string style to use for the control.

VerticalAlignment

Sets the vertical alignment of text within the control. Select from Top, Middle, or Bottom.

Behavior

Behavior	Label	Textbox	Subreport	Checkbox	Picture	Shape	Line	Rich Textbox	Page Break	Barcode	Chart	OLE Object
Angle	•											
AutoSize										•		
CanGrow		•	•					•				
CanShrink		•	•					•

Enabled									•			
Multiline	•	•						•				
RightToLeft	•	•										
Visible	•	•	•	•	•	•	•	•	•	•	•	•
Wordwrap	•	•		•								

Angle

Sets the angle of the text within the control area.

AutoSize

Set to True to automatically have the barcode stretch to fit the control. Set to False to leave the barcode size static.

CanGrow

Indicates whether the height of the control can grow, if needed, based on the content within the control. Select True to allow the control's height to grow. Select False to force the control's height to remain the same regardless of the content within it.

CanShrink

Indicates whether the height of the control should be adjusted based on the content within the control. Select True to allow the control's height to adjust. Select False to force the control's height to remain the same regardless of its content.

CaptionPosition

Specifies the position of the barcode caption relative to the barcode symbol.

None: Caption is not printed.

Above: Caption is printed above the barcode symbol.

Below: Caption is printed below the barcode symbol.

CheckAlignment

Sets the alignment of the checkbox text within the control drawing area.

Checked

Set to True if the check box is in the checked state; otherwise, False. The default value is False.

CheckSumEnabled

Determines whether the checksum of a barcode will be computed and included in the barcode when applicable. This property has no effect if the barcode style is EAN-13 which requires a check digit. Set to True to enable the checksum. Set to False to disable the checksum.

Enabled

Determines whether the PageBreak is currently enabled.

MultiLine

Sets the ability of a RichTextBox control to print a single or multiple lines.

RightToLeft

Used to allow the control to support text that should be printed right to left. Set to True to support right to left printing; otherwise set to False.

Visible

Set this property to True to print the control. Set this property to False to hide (not print) the control.

WordWrap

Indicates whether a multi-line control automatically wraps words to the beginning of the next line when necessary. Select True to force automatic wordwrap; otherwise select False.

Chart

Chart	Label	Textbox	Subreport	Checkbox	Picture	Shape	Line	Rich Textbox	Page Break	Barcode	Chart	OLE Object

AutoRefresh

Sets a value to indicate whether the chart will be automatically refreshed for every property change.

⊞Backdrop

Sets the background style for a chart control.

Style

Specify the type of backdrop to use. Select from Transparent, Solid, Gradient, Pattern and Picture.

Color

Specify the primary color to use to fill the backdrop.

Gradient

Specify the GradientType used for the Backdrop. Select from Horizontal, Vertical, DiagonalUp, DiagonalDown, FromCenter, and FromCorner.

Color2

Specify the secondary color to use for gradient effects and patterns.

Alpha

Specify the alpha level (transparency).

ChartAreas

A collection of values that define the properties of a chart. Click the ellipsis to set the specific chart properties.

⊞ChartBorder

Sets the border to be used to draw around the chart.

⊞Line

Specify the line style used to draw the border of the graph.

Style

Specify the style to use to draw the line. Select from None, Solid, Dash, Dot, DashDot, DashDotDot.

Color

Specify the color of the line.

Weight

Specify the line thickness in points.

ShadowWeight

Specify the width of the shadow outlining the border.

ShadowColor

Specify the color of the shadow outlining the border.

ColorPalette

Sets the color palette used for the chart.

DataSource

Sets the data source for the chart control.

⊞GridLayout

Rows

Sets the number of rows for the grid.

Columns

Sets the number of columns for the grid.

Legends

Defines the properties for chart legends.

Series

Defines the number of series the chart will use. The properties for each series is also set within this collection.

Titles

Defines the number of titles the chart will use. The properties for each title is also set within this collection.

Data

Data	Label	Textbox	Subreport	Checkbox	Picture	Shape	Line	Rich Textbox	Page Break	Barcode	Chart	OLE Object
Class												•
ClassName	•	•		•								
CountNullValues		•

Image					•							
MaxLength								•				
ReportName			•									
Tag	•	•	•	•	•	•	•	•	•	•	•	•
Text	•	•		•						•		

Class

Specify the class name of the Ole object.

ClassName

Sets a style rule class name used to format the control.

CountNullValues

Determines whether Null values should be included as zeroes in summary fields.

DataField

Specifies the data field to be used for grouping. Changes in the value of the specified data field are monitored and a new group is started when the value changes. Current groups are ended (i.e. the group footer section is printed) before the new group is started.

HyperLink

Defines a URL address that will be launched in Internet Explorer when clicked.

Image

Defines the image to be used in the Picture control.

MaxLength

Defines the maximum number of characters that can be entered in the RichTextBox control. A value of 0 allows an unlimited size.

ReportName

This property is used to defined the name of the subreport being called by the subreport control. This property is used for informational purposes only.

Tag

Sets user-defined information to be persisted with the control.

Text

Defines the text to be displayed in the control.

Design

Design	Label	Textbox	Subreport	Checkbox	Picture	Shape	Line	Rich Textbox	Page Break	Barcode	Chart	OLE Object
(Name)	●	●	●	●	●	●	●	●	●	●	●	●

(Name)

Enter a string of text that will be used as the control's name.

Layout

Layout	Label	Textbox	Subreport	Checkbox	Picture	Shape	Line	Rich Textbox	Page Break	Barcode	Chart	OLE Object
BarWidth										●		
+Location	●	●	●	●	●	●	●	●	●	●	●	●

Height	●	●	●	●	●	●	●	●		●	●	●
SizeMode					●							●

BarWidth

This property sets the width for the barcode's narrow bars. Setting the width to 0 expands the barcode to fit the control. The width ratio is 1 to 0.012 inches. So setting the BarWidth to 2 will have a value of 0.024 inches, while a value of 10 yields a bar width of 0.12 inches for the narrowest bars.

⊞Location

Sets the X-Y position of the control.

X

Sets the X position of the control.

Y

Sets the X position of the control.

⊞Size

Defines the size of the control

Width

Sets the Width of the control in inches.

Height

Sets the Height of the control in inches.

SizeMode

Determines how the image is sized to fit the Picture control area.

Clip: The image is clipped to fit within the control area.

Stretch: The image is stretched to fit the control area.

Zoom: The image is scaled until it fits horizontally and vertically within the control area.

⊞Code49

Grouping

If Grouping is set to True, the Group property may be set to a number between 0 and 8. The default values are False and 0, respectively.

Group

If Grouping is set to True, the Group property may be set to a number between 0 and 8. The default values are False and 0, respectively.

ImageType

Sets the type of image to which the chart will be rendered on the report (Metafile, PNG).

Modifiers

For future use only.

⊞PDF417

Pdf417 is a popular high-density 2-dimensional symbology that encodes up to 1108 bytes of information. This barcode consists of a stacked set of smaller barcodes. Encodes the full ASCII character set. Capable of encoding as many as 2725 data characters.

Column

Sets column numbers for the barcode.

Row

Sets row numbers for the barcode.

ErrorLevel

Sets the error correction level for the barcode.

Type

Sets the PDF417 barcode's type.

⊞QRCode

QRCode is a 2D symbology that is capable of handling numeric, alphanumeric and byte data as well as Japanese kanji and kana characters. This symbology can encode up to 7,366 characters.

Model

Sets the QRCode's model

ErrorLevel

Sets the error correction level for the barcode

Version

Sets the QRCode's version.

Mask

Sets the pattern used for the barcode's masking.

Connection

Sets whether connection is used for the barcode.

ConnectionNumber

Sets the connection number for the barcode.

X1

Sets the horizontal coordinate of the line's starting point.

X2

Sets the horizontal coordinate of the line's ending point.

Y1

Sets the vertical coordinate of the line's ending point.

Y2

Sets the vertical coordinate of the line's ending point.

Summary

DistinctField

Sets the name of the data field used in a distinct summary function.

SummaryFunc

Defines the type of summary calculation to be performed on the data contained within the control. Choose from Sum, Avg, Count, Min, Max, Var, StdDev, StdDevP, DSum (based on distinct values), DAvg (based on distinct values), DCount (based on distinct values), DVar (based on distinct values), DVarP (based on distinct values),

DStdDev (based on distinct values), DStdDevP (based on distinct values). All summary calculations are based on the values in the specified summary region.

SummaryGroup

Defines the name of the group header section that is used to reset the summary value when calculating subtotals.

SummaryRunning

Determines whether the data field summary value will be accumulated or reset for each level (detail, group or page).

None: Summary values are not accumulated.

Group: Calculates a running summary (each value is the sum of the current value and all preceding values) within the same group level.

All: Calculates a running summary for all values in the report.

SummaryType

Determines the summary type to be performed.

None: No summarization.

GrandTotal: Evaluate the specified summary function for all records in the report.

PageTotal: Evaluate the specified summary function for all records on each page.

SubTotal: Evaluate the specified summary function for all records in each group level.

PageCount: Print the page count or page number. Used with SummaryRunning set to All to print the page number.

Pre-defined reports

Desktop Authority includes several pre-defined reports for use within the Reporting tool. Pre-defined reports may be used as is or modified to suit ones particular needs.

The pre-defined report set includes the following report categories:

- Administrator Audit
- Hardware Inventory
- Miscellaneous
- Profile
- Profile Objects
- Software Inventory
- Software Management
- USB-Port Security
- User Activity

Pre-defined report parameters

All pre-defined reports have a parameter dialog that displays prior to the actual report. This parameter dialog is used to filter data on the reports. The filters offered for each report are used in the SQL statement that fetches the data for the report. The parameter dialogs differ based on the selected report.

In the parameter dialogs, all character based values can use the % wildcard value. A % symbol can be added to the beginning and/or end of a phrase.

%RD will return all values that end with RD
RD%   will return all values that start with RD
%RD%   will return all values that contain the characters RD

Example Parameter Dialog:

Report Parameters	
Report Parameters	
Administrator Name:	All
Administrator Domain:	All
Administrator OU:	All
Administrator Group:	All
Profile Name:	All
Element Type:	All
Log Start Date:	6/27/2017 12:00:00 AM
Log End Date:	7/28/2017 12:00:00 AM

OK   Cancel

This example demonstrates the use of a wildcard value in the Computer Name parameter. In this case, using PC% in the computer name field, will return all data corresponding to computers that begin with the letters 'PC'.

Reports - Administrator Audit

Admin Audit - Administrator Activity

The Administrator Activity report details the activity of one or more administrators. Collected operations include:

Type	Operation	Description
Profile	Add	A Profile has been added.
Profile	Update	A Profile has been changed.
Profile	Delete	A Profile has been deleted.
Profile	ForceUnlock	A Profile has been unlocked by another user.
Profile	Published	A Profile has been replicated to the Domain Controllers.
ProfileElement	Add	An Element has been added to a profile.
ProfileElement	Update	An Element has been changed in a profile.
ProfileElement	Delete	An Element has been deleted from a profile.
User	Add	A User or group has been added to the Super User/Group list.
User	Update	A User or group has been updated in the Super User/Group list.
User	Delete	A User or group has been deleted from the Super User/Group list.
Role	Add	A Role has been added to the Roles table.
Role	Update	A Role has been updated in the Roles table.
Role	Delete	A Role has been deleted from the Roles

Type	Operation	Description
		table.
Role	ForceUnlock	A Record lock has been removed by another user.
RoleUser	Add	A SID has been added to the RoleUsers table.
RoleUser	Update	A SID has been updated in the RoleUsers table.
RoleUser	Delete	A SID has been deleted from the RoleUsers table.

Report parameters:

Sample report:

Admin Audit - Profiles

The Profile Activity report details the activity executed on one or all profiles. The activities detailed are Profile Add, Update, Delete, Unlock and Replicate, and Element Add, Update and Delete. The report includes the date and time the operation took place, the actual operation along with a description of the operation, the profile acted upon and the administrator that performed the operation.

The Profile Activity report prompts the user for the Name of the Profile and Element Type to report on as well as the Start and End Date range to include in the report. By default, the Profile Activity report is sorted in Log Date/Time order.

Report parameters:

Sample report:

Admin Audit - Profiles

Report Date/Time: 7/12/2011 10:59 AM
Report Parameters: Profile Name: All, Element Type: All, Log Start Date: 06/12/2011 00:00:00, Log End Date: 07/13/2011 00:00:00

Report Description: The Profile Activity report details the activity executed on one or all profiles.

Log Time	Operation	Element Type	Element Description	Profile Name	Description	Administrator

Admin Audit - Roles Maintenance

The Roles Maintenance report details the activity with respect to adding, updating and deleting local and global roles. The activities detailed are Profile Add, Update, Delete, Unlock and Replicate, and Profile Element Add, Update and Delete. The report includes the date and time the operation took place, the actual operation along with a description of the operation, the profile acted upon and the administrator that performed the operation.

Report parameters:

Reports - Hardware Inventory

Hardware Inventory - Computers Missing report lists computers that were detected by Desktop Authority at one time on the network, but are no longer found to be active. For example, if Computer X was found on the network every day for a couple of weeks and then was not found at all for the next 2 weeks, Computer X would show as a computer that was not found within the last week.

Report parameters:

Sample report:

Hardware Inventory -Detailed - Summary Page

The Hardware Inventory - Detailed - Summary Page report reports on data collected from computers logging onto the network. The report includes a summary of the Operating Systems, Physical Memory, Processors and Computer Classes and is followed by the details for each computer.

The Hardware Inventory - Detailed - Summary Page report prompts the user for the Computer Name, Computer OU, Virtual Machine type, Operating System, Computer Platform and Scanned Since Date.

Report parameters:

⊞Hardware Inventory - Monitors

The Hardware Inventory - Monitors report reports on data collected from computers logging onto the network.

The Hardware Inventory - Monitors report prompts the user for the Computer Name, Computer OU, Virtual Machine Type, Computer Platform and Scanned Since Date.

Report parameters:

Report Parameters	
Computer Name:	All
Computer OU:	All
Is Virtual Machine:	All
Platform:	All
Scanned Since:	11/22/2010 12:00:00 AM

OK   Cancel

Sample Report:

Hardware Inventory - Summary

The Hardware Inventory - Summary report reports on data collected from computers logging onto the network. The report summarizes each computer's name, class, manufacturer, model, memory, operating system and the date it was last scanned.

The Hardware Inventory - Summary report prompts the user for the Computer Name, Virtual Machine type, Scanned Since and Computer Platform.

Report parameters:

Report Parameters	
Computer Name:	All
Computer OU:	All
Is Virtual Machine:	All
Operating System:	All
Platform:	All
Computer Type:	Workstation
Scanned Since:	11/22/2010 12:00:00 AM

[OK]   [Cancel]

Sample report:

Hardware Inventory - Windows 7 Compatibility 32-bit

The Hardware Inventory - Windows 7 Compatibility 32-bit report presents data collected from computers that meet the minimum requirements of Windows 7 (32-bit) operating system.

The Hardware Inventory - Windows 7 Compatibility 32-bit report prompts the user for the Scanned Since date,>Computer Name, Computer OU, Computer Platform and Virtual Machine type.

Report parameters:

Report Parameters	
Computer Name:	All
Computer OU:	All
Is Virtual Machine:	All
Computer Type:	Workstation
Scanned Since:	11/22/2010 12:00:00 AM

Avg Energy Cost for Total Computers per Work Day with Power Management	$12.72
Avg Energy Cost for Total Computers per Non-Work Day with Power Management	$0.96
Estimated Power Savings For All Desktops & Laptops	
Total Saved Energy Cost For Total Computers Per Year with Power Management	**$4,666.67**

* EPA estimates computer idleness at 58% during the average work day (listed on 01/18/2007 from: http://eetd.lbl.gov/EA/Reports/39466/39466.PDF)

** EPA estimates 36% of computers are currently being shut-down at the end of the workday (listed on 01/18/2007 from: http://eetd.lbl.gov/EA/Reports/39466/39466.PDF)

*** DOE national average as of 2005 was $0.0867 per kWh (listed on 01/18/2007 from: http://www.eia.doe.gov/cneaf/electricity/epa/epat7p4.html)

**** "Computer and Monitor Idle" average energy usage corresponds to "the EPA Computer spec 4.0 or system is sitting at the main Windows screen." "In-Use" energy usage corresponds to "the highest wattage reading while running the complete 3DMark 2003 Pro (Benchmark) suite of tests." For simplicity sake, "Sleep, Standby, Hibernate, and Off" all correspond to the close average of "Suspend-to-RAM (low power mode)", "Suspend-to-Disk (a lower power mode)", and "Off Low Power Mode disabled" - Desktop Optiplex line (listed on 01/18/07 from: http://www1.us.dell.com/content/topics/global.aspx/corp/environment/en/prod_datasheets? c=us&cs=555&l=en&s=biz. Hard drive average energy usage of 80-200GB 7200 RPM hard drive (listed on 01/18/07 from: http://www.seagate.com/docs/pdf/datasheet/disc/ds_db35.pdf)

Logging - Default

The Logging report is used to track information about users logging onto the network and the computer they are logging from. The specific data collected can be customized within the Logging profile object. The default collection data set includes:

- User Login Date/Time
- Authenticating Domain controller
- Connection Method
- Computer name
- Computer type
- TCP/IP address
- CPU type
- CPU speed
- Physical RAM
- System drive
- Verbose Operating System version
- Current service pack
- User ID
- User's full name
- User account description
- Event Type

This report is included for use with legacy systems that use the logging data files (.CSV) from prior versions of Desktop Authority. This report can also be used to export data to Excel or other systems for further manipulation and/or study.

Total Saved Energy Cost For Total Computers Per Year with Power Management	**$4,666.67**

* EPA estimates computer idleness at 58% during the average work day (listed on 01/18/2007 from: http://eetd.lbl.gov/EA/Reports/39466/39466.PDF)

** EPA estimates 36% of computers are currently being shut-down at the end of the workday (listed on 01/18/2007 from: http://eetd.lbl.gov/EA/Reports/39466/39466.PDF)

*** DOE national average as of 2005 was $0.0867 per kWh (listed on 01/18/2007 from: http://www.eia.doe.gov/cneaf/electricity/epa/epat7p4.html)

**** "Computer and Monitor Idle" average energy usage corresponds to "the EPA Computer spec 4.0 or system is sitting at the main Windows screen." "In-Use" energy usage corresponds to "the highest wattage reading while running the complete 3DMark 2003 Pro (Benchmark) suite of tests." For simplicity sake, "Sleep, Standby, Hibernate, and Off" all correspond to the close average of "Suspend-to-RAM (low power mode)", "Suspend-to-Disk (a lower power mode)", and "Off Low Power Mode disabled" - Desktop Optiplex line (listed on 01/18/07 from: http://www1.us.dell.com/content/topics/global.aspx/corp/environment/en/prod_datasheets?c=us&cs=555&l=en&s=biz. Hard drive average energy usage of 80-200GB 7200 RPM hard drive (listed on 01/18/07 from: http://www.seagate.com/docs/pdf/datasheet/disc/ds_db35.pdf)

Report template (Landscape/Portrait)

The ReportTemplateLandscape and ReportTemplatePortrait reports are template reports that are used with the User-Defined Report Wizard. These reports should not be modified.

Reports - Profile Objects

Profile Full Detail

The Profile Full Detail report details on selected objects and elements for the specified profile(s). The report includes a Profile Summary followed by each of the selected object element details including Validation Logic, Created By, Last Modified Date and Last Modified By.

The Profile Full Detail report prompts the user for the Profile Name, Parent Profile Name and Profile Objects. All elements of each profile and profile object are grouped together.

Report parameters:

The Profile Full Detail report details all elements for the selected profile objects in the report parameters dialog. Each profile object along with its associated profile elements are displayed in alphabetical order. The details for

each profile object elements is the same as the individual profile object reports. Examples of each profile objects detail can be seen under the particular profile object report section.

Profile Full Detail -Computer Management

The Profile Full Detail report details on selected objects and elements for the specified profile(s). The report includes a Profile Summary followed by each of the selected object element details including Validation Logic, Created By, Last Modified Date and Last Modified By.

The Profile Full Detail report prompts the user for the Profile Name>, Parent Profile Name and Profile Objects. All elements of each profile and profile object are grouped together.

Report parameters:

The Profile Full Detail (Computer Management) report details all elements for the selected profile objects in the report parameters dialog. Each profile object along with its associated profile elements are displayed in alphabetical order. The details for each profile object elements is the same as the individual profile object reports. Examples of each profile objects detail can be seen under the particular profile object report section.

Profiles Summary

The Profiles Summary summarizes all existing profiles in the Manager. The report includes the following profile information: Profile Name, Parent Profile Name, Child Profiles, Last Modified Date and Profile Validation Logic.

The Profiles Summary prompts the user for the Profile Name and Parent Profile Name.

This report is ordered by the selected Order by field.

Report parameters:

▶	Profile Name:	New Profile
	Parent Profile Name:	None
	Order By:	[Profile Name]

Reports - Software Inventory

Software Inventory - Summary Page

The Software Inventory - Summary Page report reports on data collected from computers logging onto the network. The report details each computer's installed software. The report includes graphical representation of the software installed on computers reported on and the number of installations for each application. It is followed by the software details for each computer.

The Software Inventory report prompts the user for the Scanned Since, Computer Name and Virtual Machine type.
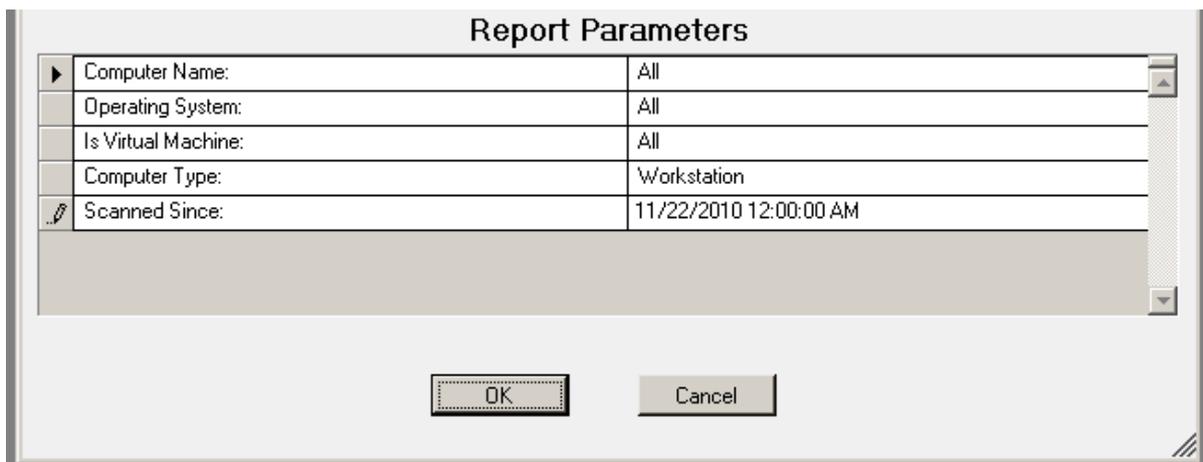

Report parameters:

Report Parameters	
Computer Name:	All
Operating System:	All
Is Virtual Machine:	All
Computer Type:	Workstation
Scanned Since:	11/22/2010 12:00:00 AM

OK   Cancel

Sample report:
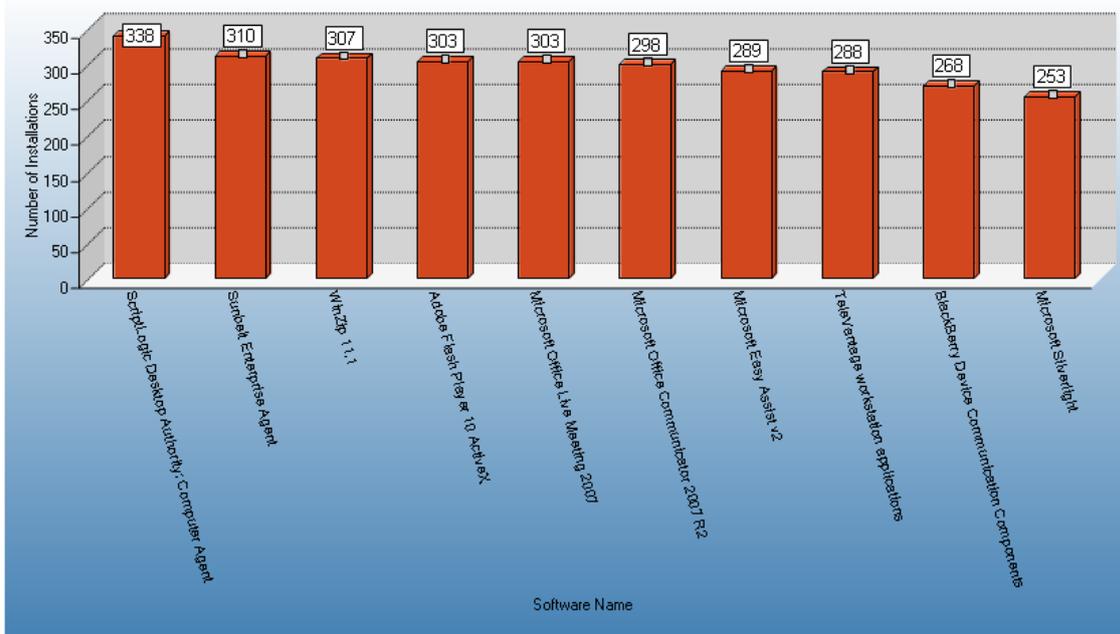

Software Inventory - Total Installations

The Software Inventory - Total Installations report reports on data collected regarding installed applications. The report counts the various applications on each desktop based on collected data.

The Software Inventory - Total Installations report prompts the user for the Report Date to include Computer Name, Computer OU, Virtual Machine type, Scanned Since and Software Name.

This report is ordered by Software Name and Number of Installations in descending order.

Report parameters:

Report Parameters

Reports - USB-Port Security

USB-Port Security - All Device Events

The USB-Port Security - All Device Events report reports on data collected about the following device events: Plugin/Powerup, Unplug/Disable, Device Disabled, Device Enabled, Read and Write Denied and Read and Write Allowed. Filenames will be reported on all read and write events to a removable storage device.

The USB-Port Security - All Device Events report prompts the user for the Event type, Virtual Machine type, Computer type and Scanned Since date to report on.

This report is ordered by Log Time.

Report parameters:

Report Parameters		
▶	Event:	All
	Is Virtual Machine:	All
	Computer Type:	Workstation
✎	Logged Since:	11/23/2010 12:00:00 AM

⊞USB-Port Security - Top 10 Denied

The USB-Port Security - Top 10 Denied report is a graphical report displaying the Top 10 Devices Attempted to be Used but Restricted and the Top 10 Users Attempting to use a Restricted Device. The Top 10 Devices Attempted to be Used but Restricted graph is grouped by device class. The Top 10 Users Attempting to use a Restricted Device is grouped by User Domain/User Name.

The USB-Port Security - Top 10 Denied report prompts the user for the Scanned Since date to report on. The report can also be run for All machines, Virtual Machines only or Non-virtual Machines only.

Report parameters:

Sample report:

⊞USB-Port Security - Users Denied

The USB-Port Security - Users Denied report reports on data collected about Users that generated denied and/or disabled device events. The report is grouped by User Domain, User Name, Class Description and Device Description.

The USB-Port Security - Users Denied report prompts the user for the Scanned Since date to report on. The report can also be run for All machines, Virtual Machines only or Non-virtual Machines only.

Report parameters:

Sample report:

⊞USB-Port Security - Users Denied (Fixed Devices)

The USB-Port Security - Users Denied (Fixed Devices) report reports on data collected about Users that generated denied and/or disabled device events. The report is grouped by User Domain, User Name, Class Description and Device Description.

The USB-Port Security - Users Denied(Fixed Devices) report prompts the user for the Scanned Since date to report on. The report can also be run for All machines, Virtual Machines only or Non-virtual Machines only.

Report parameters:

Sample report:

_⊞USB-Port Security - Users Denied (Portable Devices)

The USB-Port Security - Users Denied(Portable Devices) report reports on data collected about Users that generated denied and/or disabled device events. The report is grouped by User Domain, User Name, Class Description and Device Description.

The USB-Port Security - Users Denied (Portable Devices) report prompts the user for the Scanned Since date to report on. The report can also be run for All machines, Virtual Machines only or Non-virtual Machines only.

Report parameters:

Sample report:

Reports - User Activity

User Activity - Machine User Usage

The User Activity - Machine User Usage report details user activity on each computer. Total active and inactive session times are calculated. Total active time per session is the time between logon or unlock to lock or logoff. Total inactive time is (total working hours for the time period) (total active time for the time period).

Usage events are grouped by computer and then by each user of the computer.

Report parameters:

Total Active Time During Session: 12.5 hours

Total Active Time During Period Specified: 12.5 hours
Total Inactive Time During Period Specified: 27.5 hours

User Activity - Summary Page

The User Activity - Summary Page report displays, graphically, user activity across multiple computers. Usage events are grouped by user, then by each computer they have logged on to. Total active time is tallied for all computers. Total active time per session is (login or unlock) to (lock or logoff). Total inactive time is (total working hours for the time period) (total active time for the time period) (no lower than 0).

This report can be used for scenarios where users log on to multiple computers over the course of the working hours period, for example, when a user uses a different computer every day over the course of a week.
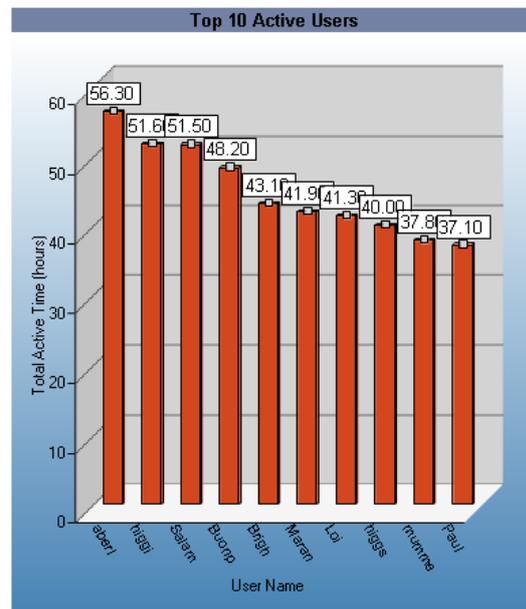

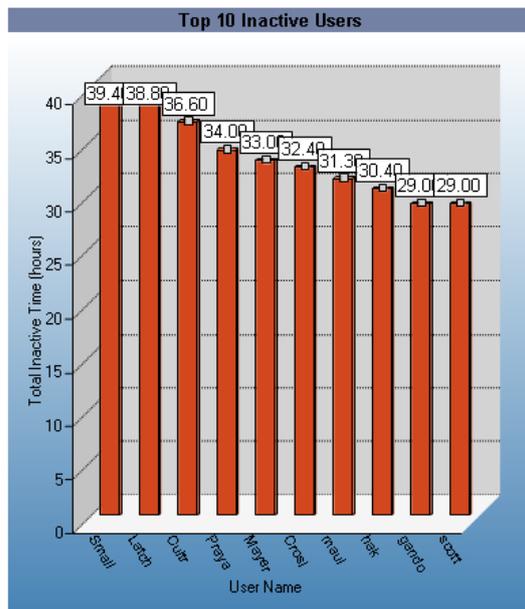

Report parameters:

Sample report:

User Activity - User Machine Usage

The User Activity - User Machine Usage report details user activity over multiple computers. Total active and inactive session times are calculated. Total active time per session is the time between logon or unlock to lock or logoff. Total inactive time is (total working hours for the time period) (total active time for the time period).

Usage events are grouped by user and then by each computer the user has logged on to.

This tends to be a large report. It may be necessary to narrow down the report parameters by user, computer or a smaller date range.

Report parameters:

Report Parameters	
User Name:	All
User Domain:	All
User OU:	All
User Group:	All
Computer Name:	All
Activity Start Date:	12/16/2010 12:00:00 AM
Activity End Date:	12/24/2010 12:00:00 AM
Total Working Hours For Period:	40

OK   Cancel

Sample report:

⊞User Activity Per Computer - Summary Page

The User Activity Per Computer - Summary Page report displays, graphically, the top 10 inactive users and top 10 active users. Total active and inactive session times are calculated. Total active time per session is the time between logon or unlock to lock or logoff. Total inactive time is (total working hours for the time period) (total active time for the time period).

This report can be used for scenarios where a user may be logged into more than one workstation at one time.

Report parameters:

Sample report:

⊞User Activity Per Computer

The User Activity Per Computer report details user activity on each computer that the user has logged on to and tallies active time for each computer. Total active and inactive session times are calculated. Total active time per session is the time between logon or unlock to lock or logoff. Total inactive time is (total working hours for the time period) (total active time for the time period).

This report can be used for scenarios where a user may be logged into more than one workstation at one time.
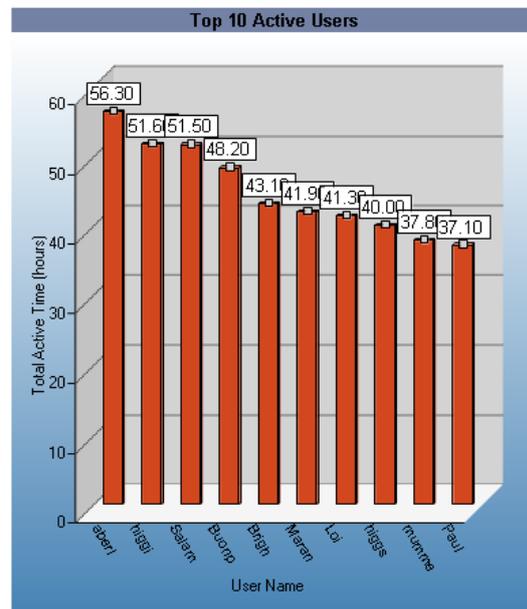

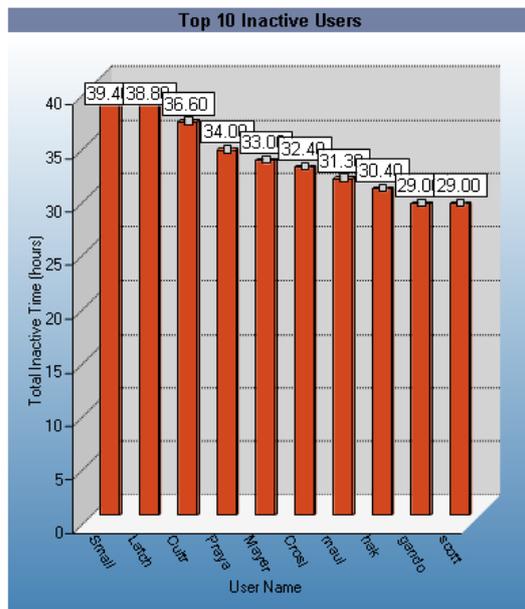

The report is grouped by User ID and Computer ID.

Report parameters:

Report Parameters	
User Name:	All
User Domain:	All
User OU:	All
User Group:	All
Computer Name:	All
Activity Start Date:	12/16/2010 12:00:00 AM
Activity End Date:	12/24/2010 12:00:00 AM
Total Working Hours For Period:	40

OK   Cancel

Sample report:

User Activity Per Computer

Report Date/Time: 12/23/2010 12:42 PM
Report Parameters: User Name: All, User Domain: All, User OU: All, User Group: All, Computer Name: All, Activity Start Date: 12/16/2010
                    00:00:00, Activity End Date: 12/24/2010 00:00:00, Total Working Hours For Period: 40

About us

Quest provides software solutions for the rapidly-changing world of enterprise IT. We help simplify the challenges caused by data explosion, cloud expansion, hybrid datacenters, security threats, and regulatory requirements. We are a global provider to 130,000 companies across 100 countries, including 95% of the Fortune 500 and 90% of the Global 1000. Since 1987, we have built a portfolio of solutions that now includes database management, data protection, identity and access management, Microsoft platform management, and unified endpoint management. With Quest, organizations spend less time on IT administration and more time on business innovation. For more information, visit www.quest.com.

Technical support resources

Technical support is available to Quest customers with a valid maintenance contract and customers who have trial versions. You can access the Quest Support Portal at https://support.quest.com.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to-videos
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
