About Foglight for Container Management

Containers are a method of operating system virtualization that allow you to run an application and its dependencies in resource-isolated processes. Foglight[®] for Container Management simplifies this process by tracking each container, the resources it consumes, and the remaining compute of the container host, as well as providing you with the cluster information and pre-configured rules with notifications identifying the problem of your clusters.

6

Architecture

Figure 1. Components of Foglight for Container Management

Others: <Kubernetes API Server Endpoint>

Foglight for Container Management consists of three main components:

- Foglight Management Server and Foglight Database Repository Responsible for managing, alerting, and viewing the collected data. Both components can be set to run on the same machine or reside on separate machines.
- Agent Manager Hosts the monitoring Kubernetes agents.
- · Docker Swarm clusters Manages containerized applications in a clustered environment.
- Kubernetes clusters Manages containerized applications in a clustered environment.

Sizing Your Monitored Environment

Consider the possibility of a great amount of objects being collected, analyzed, and maintained by the application, several aspects of the underlying server must be taken into account. The sizing of the supporting clusters and containers depends on the complexity of the underlying environment. Sufficient processing power and CPU memory are required to support effective collection, server data handling, and analytics.

i NOTE: Currently Quest validates the environment with up to 10000 containers. If your environment beyonds this scale, contact Quest Support.

Foglight Management Server Requirements

The minimum system requirements of the Foglight Management Server vary from the scale of clusters. The scale of clusters is determined by running containers.

 Table 1. Foglight Management Server requirements

Operating	Maximum	Foglight		Agent Manager	Agent Manager		
System	Containers	JVM Settings	# of CPUs	JVM Settings	# of CPUs 2 4 6		
Windows 64-bit	1000	Xms Xmx=4G	2	Xms Xmx=4G	2		
	5000	Xms Xmx=8G	4	Xms Xmx=8G	4		
	10000	Xms Xmx=12G	6	Xms Xmx=12G	6		
Linux 64-bit	1000	Xms Xmx=4G	2	Xms Xmx=4G	2		
	5000	Xms Xmx=8G	4	Xms Xmx=8G	4		
	10000	Xms Xmx=12G	6	Xms Xmx=12G	6		

If you are using an embedded Agent Manager, make sure to use the sum resources of both Foglight and Agent Manager.

Kubernetes Agent Requirements

Kubernetes Agent collects inventory and metrics every 5 minutes by default. Refer to Configuring data collection interval for details about how to change the collection interval.

Table 2. Kubernetes Agent requirements

Maximum Containers	Kubernetes Agent Col	Kubernetes Agent Collection Interval (minutes)	
	Inventory	Metrics	
500	5	5	
1000	10	10	
5000	30	30	
10000	60	60	

Table 2 is the recommendations for local Kubernetes clusters. If you deploy Kubernetes clusters on the Cloud Provider Kubernetes Service, consider your network rate and change your configurations based on different Cloud Provider and different region/zone of your cluster.

Docker Swarm Agent Requirements

Docker Swarm Agent collects inventory and metrics every 5 minutes by default. Refer to Configuring data collection interval for details about how to change the collection interval.

Table 3. Docker Swarm Agent requirements

Maximum Containers	Docker Swarm Agent Collection Interval (minutes)		
	Inventory	Metrics	
500	5	5	
1000	10	10	
5000	30	30	

Table 3 is the recommendations for local Docker Swarm clusters. For cloud environment, consider network rate and change configurations based on different Cloud Provider and different region/zone.

Foglight for Container Management 6.1.0 User and Administration Guide Understanding Foglight for Container Management

8

Getting Started

- Prerequisite
 - Kubernetes Agent
 - Preparing the Kubernetes credential
 - Enabling Heapster service in monitored environment
 - Enabling Prometheus service in monitored environment
 - Docker Swarm Agent
 - Preparing Docker Swarm Agent credentials
 - Enabling Docker Remote API for monitored docker host
 - Uploading Docker Swarm Agent credentials
- Creating and Activating Agent
 - Creating and Activating a Kubernetes Agent
 - Creating and Activating a Docker Swarm Agent
- Configuring data collection interval

Prerequisite

Kubernetes Agent

Each Kubernetes Agent monitors the assets inside the selected Kubernetes Service Providers. To enable the data collection, complete the following prerequisites before create agent.

- Preparing the Kubernetes credential
- · Enabling Heapster service in monitored environment

Preparing the Kubernetes credential

The Kubernetes configuration file named *KubeConfig* is a standard configuration of Kubernetes and is required for Kubernetes agents to access the cluster. Foglight for Container Management verifies and supports the local Kubernetes and the following Cloud Kubernetes Service Providers. Based upon your environment, select either of approaches to get your *KubeConfig* file:

- i NOTE: Data from different Kubernetes Agents with the same cluster name will be merged into one cluster.
 - Local Kubernetes
 - Azure Kubernetes Service (AKS)
 - Amazon Elastic Container Service for Kubernetes (EKS)
 - Google Cloud Platform Container Engine (GKE)
 - IBM Cloud Kubernetes Service
 - OpenShift Origin

Local Kubernetes

If you build a Kubernetes cluster locally, find this *KubeConfig* file under the /etc/kubernetes/admin.kubeconfig on your master node.

9

Azure Kubernetes Service (AKS)

Before generating the Kubernetes credentials, record the following information:

- Azure Username
- Azure Password

i

- Azure Subscription Number
- The name of your AKS Cluster Resource Group
- The name of your AKS cluster

Download the Azure Command Line Interface and install it in your local platform, and then follow steps below to generate your Kubernetes credential:

1 Run the command *az* login.

Then a browser shows up, directing you to the Azure Portal where you should enter your Azure Username and Password to complete the authentication.

- 2 Run the command: az account set --subscription <azure subscription number>
- 3 Run the command: az aks get-credentials --resource-group <azure resource group name> --name <azure cluster name>
- 4 Find the Kubernetes configuration file under <USER HOME>/.kube/config on your local platform.

NOTE: The token in this Kubernetes configuration file will get expired after two years. If you don't want the credential gets expired, refer to Foglight Container Tools for detail.

Amazon Elastic Container Service for Kubernetes (EKS)

Follow the Amazon EKS offical guide Getting Started with Amazon EKS. Follow the guide and complete Create a kubeconfig for Amazon EKS. in the end of the guide.

i NOTE: If you don't want the credential gets expired, refer to Foglight Container Tools for detail.

Google Cloud Platform Container Engine (GKE)

Download the Google Cloud Client tool and install it in your local platform, and then follow steps below to generate your Kubernetes credential.

To generate the intermediate Kubernetes credential for your cluster:

1 Log in to your Kubernetes cluster, click Connect next to your cluster name.

Kubernetes clust	ers	+ CREATE CLUST	ER 🛨 D	EPLOY C F	REFRESH	DELETE	
Kubernetes cluster is a Filter by label or name	managed group of	uniform VM instanc	es for running k	lubernetes. Learn i	more		
Name A	Location	Cluster size	Total cores	Total memory	Notifications	Labels	
🗆 🥑 -gke-demo	us-central1-a	2	2 vCPUs	4.00 GB			Connect

2 Click to copy the command below, and then run this command.

ou can connect to your cluster via command-line or using a dashboard. Command-line access Configure kubectl command line access by running the following command:
Configure kubectl command line access by running the following command:
\$ gcloud container clusters get-credentials jane-gke-demozone us-central1-aproject dulcet-bucksaw-20851(

- 3 Find the intermediate Kubernetes configuration file under *<USER_HOME>/.kube/config* on your local platform. The following is the example of this intermediate Kubernetes configuration file.
 - **i NOTE:** This Kubernetes configuration file cannot be used as the agent credential because the token in this file will get expired soon and "*cmd-path*" of the token directs to your local platform.

kind: Config
preferences: {}
Jaers:
- name: gke_dulcet-bucksaw-208510_us-central1-a_jane-gke-demo
user:
auth-provider:
config:
access-token: ya29.GlzuBVkzkoVc1VUV 7yXM50DpQ7z7ahGzFA f2008FhxZjDICXRFdAw5ytBc9dHBT90yYk
cmd-args: config config-helperformat=json
cmd-path: C:\Users\jwang7\AppData\Local\Google\Cloud SDK\google-cloud-sdk\bin\gcloud.cmd
expiry: 2018-07-04T06:44:592
expiry-key: '{.credential.token_expiry}'
token-key: '{.credential.access_token}'
Bamai gon

- 4 Open Google Cloud Client tool and run the following commands to create a Kubernetes service account that grants with the *cluster-admin* role and the access to your Google Kubernetes Engine (GKE) cluster.
 - a kubectl create serviceaccount <service account name>
 - b kubectl create clusterrolebinding <cluster role binding name> --clusterrole=cluster-admin serviceaccount=default:<service account name>

"*default*" in the above command is the namespace name of this service account name. You can also change to other namespace names, as needed.

c kubectl describe serviceaccount <service account name>

You will get the response similar as below. Record the <secret name> for later use.

C:\>kubectl describe	serviceaccount jane-gke-sa
Name:	jane-gke-sa
Namespace:	default
Labels:	<none></none>
Annotations:	<none></none>
	<u> <none></none></u>
	jane-gke-sa-token-x2n6w
Tokens:	jane-gke-sa-token-x2n6w
Events:	<none></none>

d kubectl describe secret <secret name>

You will get response similar as below. Record the token value (exclude "token:") for later use.

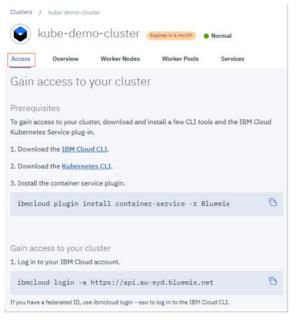

C:\>kubectl describe secret jane-gke-sa-token-x2n6w
Name:
Namespace: default
Labels: (none)
Annotations: kubernetes.io/service-account.name=jane-gke-sa
kubernetes.io/service-account.uid=9f16c355-7f4f-11e8-9c03-42010a80

5 Open the intermediate Kubernetes configuration file under <USER_HOME>/.kube/config, and then add the user and change the token to the new one.

IBM Cloud Kubernetes Service

If you have created your cluster on IBM Cloud Kubernetes Service, get the access from the console as described on the cluster's *Access* view. You will get a .pem file and a .yml file after you performing the steps.

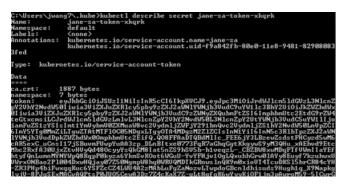

By default IBM Cloud Kubernetes Service uses certificate authority file and token/refresh token. However, certificate authority data and service account token should be used in the Kubernetes Agent credential. After you successfully test your connection through "kubectl get nodes", follow the steps below to generate the Kubernetes Agent credential.

1 Run the command *kubectl config view -minify=true -flatten -o json*. You will get an output similar as below, then record the *<certificate authority data>* for later use.

- 2 Run the command kubectl create serviceaccount <service account>.
- 3 Run the command *kubectl describe serviceaccount <service account>*. You will get a response similar as below, then record <service account secret> (in this sample, it is jane-sa-token-xkqrk) for later use.

	C:\Users\jwang7\.kuba	e>kubectl describe serviceaccount jan	e-sa
	Name:	jane-sa	
	Namespace:	default	
	Labels:	<none></none>	
	Annotations:	<none></none>	
	Image pull secrets:	<none></none>	
	Mountable secrets:	jane-sa-token-xkqrk	
	Tokens:	jane-sa-token-xkqrk	
	Events:	<pre>Knone ></pre>	
_ 1			

4 Run the command *kubectl describe secret <service account secret>*. You will get a response similar as below, then record <service account token> for later use.

5 Open the .yml file generated previously, which looks like below.

6 Change the certificate authority to the data <certificate authority data> of this authority and change the users section to use <service account token>. Save your changes, and then you will get a credential file like below. This file will be used as the Kubernetes Agent credential to connect to your IBM cloud Kubernetes service cluster.

OpenShift Origin

If you could access the file /etc/origin/master/admin.kubeconfig on the master node, download it and use it as the Kubernetes Agent credential.

If you could not access the file /etc/origin/master/admin.kubeconfig on the master node, follow instructions below to generate a permanent credential file.

Before generating the permanent Kubernetes credentials, record the following information and ensure you have granted the privilege for accessing the cluster-wide resources:

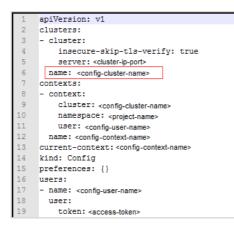

- OpenShift Username
- OpenShift Password

Download the OpenShift Command Line Interface and install it in your local platform, and then follow steps below to generate your Kubernetes credential:

- 1 Log in to OpenShift and generate an intermediate Kubernetes configuration file.
 - a After logging in to OpenShift, click Command Line Tools on the upper right.
 - b Click the button next to the *Session token* field, copy the command, and then paste it in your local Command Line Tool. Make sure to find the intermediate Kubernetes configuration file under <*USER HOME>/.kube/config* on your local platform.

c On your local platform, browse to open this configuration file. You may see the context similar to the following. Record **<config-cluster-name>** for later use.

- 2 The token generated in step 1 will be expired after 4 hours, however Foglight for Container Management needs a permanent Kubernetes credential. So you need to create a service account with "cluster-admin" role, and then get the authorization code (not expired) of this service account to generate our permanent Kubernetes credential.
 - a Run the command oc project <project-name>.
 - b Run the command oc create serviceaccount <service-account-name>.

You can check if your service account has been created successfully using the command: *kubectl get serviceaccounts*

c Run the command *oc serviceaccounts get-token* **<service-account-name>**. Then you will get a token **<service-account-token>** like below. Record this token for later use.

"eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJpc3MiOiJrdWJlcm5ldGVzL3NlcnZpY2V hY2NvdW50Iiwia3ViZXJuZXRlcy5pby9zZXJ2aWNlYWNjb3VudC9uYW1lc3BhY2UiOiJkZWZh dWx0Iiwia3ViZXJuZXRlcy5pby9zZXJ2aWNlYWNjb3VudC9zZWNyZXQubmFtZSI6Im9zLWFkb WluLXRva2VuLWY0a2ZsIiwia3ViZXJuZXRlcy5pby9zZXJ2aWNlYWNjb3VudC9zZXJ2aWNlLW FjY291bnQubmFtZSI6Im9zLWFkbWluIiwia3ViZXJuZXRlcy5pby9zZXJ2aWNlYWNjb3VudC9 zZXJ2aWN1LWFjY291bnQudWlkIjoiODMzNGU0NTQtNzQ1Yy0xMWU4LWFmNmEtMDA1MDU2YjY3 NDFhIiwic3ViIjoic31zdGVtOnNlcnZpY2VhY2NvdW500mRlZmF1bHQ6b3MtYWRtaW4ifQ.RW H_AoXy2U1elkHN_Bs9IR1xo0zNCJ1wcY0h3zuQnrkOFi8gVpX1177uhAPp7oIjPqDSWkUAN9F 6mP_tNdGwJsqRmHYEMOtCLnnIM61BYxIcABvwr66a0Z3Gn0D7EM5M_7XgKDC160N3W5NaH0D8 DpVTYqxkQ49u3qt4gqrcjVCaSsDNWlgGxY4KOIDrUbKkdgaRKzeD9o4Bv9VbYICqyxwoUebku JAcHiXGIcSe-ozS_zroPi1tT5HW-RY0Pn3Fp3zBnydiokna0-mXot51qoYc-R6E1U9YSrAOhWm9Q8ipiut60czXbmLPM4DYve6dmHi j5FquCqhod-QlA7aPw"

- d Run the following command to grant your service account with the "cluster-admin" privilege: kubectl create clusterrolebinding <cluster-role-binding-name> -clusterrole=cluster-admin --serviceaccount=default:<service-accountname>.
- 3 Generate a permanent Kubernetes configuration file and save it under <USER_HOME>/.kube/config file/credential.
 - a Open and edit the intermediate configuration file.
 - b Use kubectl to add user credentials, create new context, in the end change the existing contexts to the ones that you added in step 2.

For example,

```
kubectl config set-credentials <credential-name> --token=<service-
account-token>
kubectl config set-context <new-context-name> --cluster=<config-cluster-
name> --user=<credential-name> --namespace=<project-name>
kubectl config use-context <new-context-name>
```

c Save the current Kubernetes configuration file.

Enabling Heapster service in monitored environment

There are various approaches to enable Heapster on your Kubernetes cluster. Visit Heapster official website to determine the approach that you are going to deploy your Heapster service, or you can follow instructions in https://github.com/foglight/container to deploy your service.

Some of the cloud platform Kubernetes service has enabled Heapster service for the cluster. If you have connected to the cluster, run the following command to check: *kubectl cluster-info*

Enabling Prometheus service in monitored environment

There are various approaches to enable Prometheus on your Kubernetes cluster. Visit Prometheus Official Website to determine the approach that you are going to deploy your Prometheus service. Or you can refer to configuration management systems, such as helm (https://github.com/helm/charts/tree/master/stable/prometheus) or ansible (https://github.com/cloudalchemy/ansible-prometheus) to simplify your installation process.

In the Foglight Container **Administration** dashboard, a simple template is provided for you to deploy Prometheus service onto your cluster. For more information, see the Deploy/Migrate section in Metrics Collector on page 56.

Docker Swarm Agent

Each Docker Swarm Agent monitors the assets in one docker host. Docker Remote API needs to be enabled for the Docker Swarm Agent collecting data from the docker host. If TLS is enabled to secure the Docker Remote API, credential for Docker Swarm Agent needs to be prepared. Complete the following prerequisites before create agent.

- Preparing Docker Swarm Agent credentials
- Enabling Docker Remote API for monitored docker host
- Uploading Docker Swarm Agent credentials

Preparing Docker Swarm Agent credentials

If TLS enabled to secure Docker Remote API, then complete the following guide to get the credentials for Docker Swarm Agent for the docker host. Otherwise, continue with Enabling Docker Remote API for monitored docker host on page 17

Refer to the <u>official guide</u> to generate the keys. Be aware that, during generating the keys, the Foglight Agent Manager host address should be in the allow access list.

Docker Swarm Agent needs following credentials, you can get them when you finish the official quide.

- CA Public Key (ca.pem in official guide)
- Client Public Key (cert.pem in official guide)
- Client Private Key (key.pem in official guide)

Enabling Docker Remote API for monitored docker host

Change *ExecStart* in docker service startup script as below.

Non-TLS secured

```
ExecStart=/usr/bin/dockerd -H tcp://0.0.0.0:2375 -H
unix:///var/run/docker.sock
```

i NOTE: Access should be allowed to the TCP port 2375

TLS secured

If TLS enabled, complete Preparing Docker Swarm Agent credentials on page 17 first, then you will get the ca.pem, server-cert.pem and server-key.pem mentioned in the <u>official guide</u>.

```
ExecStart=/usr/bin/dockerd --tlsverify --tlscacert=ca.pem --tlscert=server-
cert.pem --tlskey=server-key.pem -H tcp://0.0.0.0:2375 -H
unix:///var/run/docker.sock
```

i | NOTE: Access should be allowed to the TCP port 2375

Then restart docker service.

Uploading Docker Swarm Agent credentials

If TLS is enabled to secure Docker Remote API, go through this section to upload the credential for Docker Swarm Agent. Otherwise, skip this section.

When complete Preparing Docker Swarm Agent credentials on page 17, following credentials should be generated.

- CA Public Key
- Client Public Key
- Client Private Key

These are the credentials for Docker Swarm Agent, complete the following steps to upload the credentials.

On the Administration > Credentials > Manage Credentials dashboard, click Add, and then select Docker CA Public Key or Docker Client Public Key or Docker Client Private Key to upload related credentials. Take Docker CA Public Key as an example.

Foglight for Container Management 6.1.0 User and Administration Guide Understanding Foglight for Container Management Click Add to finish editing New Resource Mapping Condition and back to Resource Mapping. And then click Finish.

The **Docker CA Public Key** has been uploaded and mapped to the docker host. To monitor this docker host, upload **Docker Client Public Key** and **Docker Client Private Key** by following the above steps.

Creating and Activating Agent

Foglight for Container Management supports Kubernetes Agent and Docker Swarm Agent.

- Creating and Activating a Kubernetes Agent
- · Creating and Activating a Docker Swarm Agent

Creating and Activating a Kubernetes Agent

To create a Kubernetes agent on a monitored host:

- 1 Log in to the Foglight browser interface and make sure the left Navigation panel is open.
- 2 On the navigation panel, from Standard View click Container Environment or from Expert View click Dashboards > Container. Then the Container dashboard will display as below.

4 Agent Manager: specify the following values, and then click Next.

		×
Agent Manager		
Select the agent n	nanager, enter the cluster name and agent name.	
Agent Manager	fms02 V	0
Cluster Name	kubernetscluster	0
Agent Name	Monitor@kubernetscluster	0
	Select the agent m Agent Manager Cluster Name	Select the agent manager, enter the cluster name and agent name. Agent Manager fms02 Cluster Name kubernetscluster

- Agent Manager: The Kubernetes Agent will be create in the selected Agent Manager.
- Cluster Name: Customized cluster name which identifies a Kubernetes cluster.
- Agent Name: Auto-generated agent name. You can change the name according to your requirement. It should be a unique name.

5 Agent Properties

Create Docker Agent			×
✓ Agent Manager	Agent Properties		
Agent Properties Credential Metrics Collector Summary	Agent Properties Kubernetes API Service End Point Collected Event Level Enable Proxy Proxy Type Proxy Server Address Proxy Server Port Collector Configuration	https://www.hulles.manopalaulustriant/http://wwwwwwwwwwwwwwwwwwwwwwwwwwwwwwwwww	0 0 0 0 0

- *Kubernetes API Service End Point*: The format is: http(s)://<url:port>. If you have a Kubeconfig file, retrieve this endpoint from the file (path: clusters -> cluster -> server). If there are multiple clusters, find the current context related cluster server URL.
- Collected Event Level: Set the collected event level, including ABNORMAL and ALL. ALL will collect both abnormal and normal events while Abnormal only collects abnormal events.

- Enable Proxy: To enable the proxy, select the checkbox. Enter the Proxy Server Address and Proxy Server Port information.
- Collector Configuration: Used to configure collection interval for inventory and metrics. You can
 change the collector intervals of defaultSchedule, however, this will affect all the Kubernetes
 Agents. Or you can create a new scheduler, configure the collector intervals, and then assign this
 scheduler to this agent.

Collector intervals to configure:

- inventory interval (inventory data collection interval).
- metrics interval (performance metrics data collection interval).

6 Credential

- If no credentials were found for the provided resource, configure credentials:
 - Credential Properties: Click Load from file to upload the credential and click Next.

Create Docker Agent		×

7 Metrics Collector

Currently both Prometheus metrics collector and Heapster metric collector are supported. However, users are encouraged to use the Prometheus metrics collector.

Create Docker Agent		×
✓ Agent Manager	Metrics Collector	
✓ Agent Properties	Heapster metrics collector is marked as Deprecated. Support for Heapster metrics collector will be removed in the future releases. Users are encouraged to switch to the new Prometheus metrics collector.	
✓ Credential		-
Metrics Collector	Select Metrics Collector Prometheus	
• Summary	Heapster	

Prometheus metrics collector

Create Docker Agent		×
✓ Agent Manager	Prometheus Configuration Mode	
✓ Agent Properties	Your prometheus required to meet the following prerequisites:	
✓ Credential	1. Prometheus services type: Cluster IP.	
 Metrics Collector 	2. Exporter needed:	
Prometheus Configuration Mode	2.1 Node - exporter:0.16.0+ 2.2 Kube - state - metrics	
 Prometheus Configuration 	Do you have prometheus in your cluster?	
	Yes, I have.	
 Summary 	○ No, I have not.	
	If you have no prometheus in your Cluster, we will provide a template for you to deploy one on the next step.	
	Prometheus Type	
	"Default" type allows Agent to use KubeConfig credentials to access the Prometheus service. "OpenShift Prometheus" type, you need to provide OpenShift Route Hostname, Username and Password for Agent to access the target OpenShift Prometheus.	
	OpenShift Prometheus	

Have existing Prometheus in your cluster.

i NOTE: Ensure that you have Prometheus in your cluster before this step. We will check the service existence and health status after you click Next.

- Select Prometheus Type.
 - Default type: allows Agent to use KubeConfig credentials to access the Prometheus service. Enter the existing Prometheus service namespace and name to configure the metrics collector.

Create Docker Agent				
✓ Agent Manager	Prometheus Con	figuration		
✓ Agent Properties	Please enter prom	netheus service information.		
✓ Credential	Namespace	kube-system	0	
 Metrics Collector 	Name	prometheus-server	0	
 Prometheus Configuration Mode 				
Prometheus Configuration				
• Summary				

- OpenShift Prometheus type: you need to provide OpenShift Route Hostname, Username, and Password for Agent to access the target OpenShift Prometheus.

Agent Properties		theus uses Route Hostname to access the OpenShift OAuth secured Hostname, Username and Password for Agent to access the target C	
Metrics Collector	Route Hostname	Hipe://prometheus-habe-sodiem.mater.defealt.ov;.diate	0
 Prometheus Configuration Mode 	OpenShift Username	openshift	8
	OpenShift Password		Θ
Prometheus Configuration			
Summary			

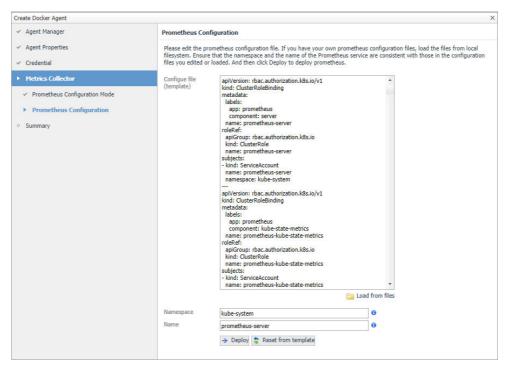

i NOTE: To find the Route Hostname, go to the **OPENSHIFT ORIGIN** dashboard, *Application* > *Routes*.

Your OpenShift Login User should have the privilege to access to the Prometheus.

Do not have existing Prometheus in your cluster.

A *Prometheus Configuration* wizard will appear. To configure the metrics collector, either use the default Prometheus template or upload your own Prometheus deployment .yml files through *Load from files*.

NOTE: Whenever you change the content in Configure file (template), ensure that the Namespace and Name fields are consistent with the Prometheus service configurations in your Configure file (template).
 If you are using the default template, there is no need to change anything.
 For a full version of the default template, see https://github.com/Foglight/Container/tree/master/prometheus

Reset from template: Helps you to reset the Configure file (template) content to the default template.

Deploy: Creates Prometheus components to your cluster with the Configure file. After clicking *Deploy*, a progress message will be displayed.

- If deployed successfully, a succeeded message will be displayed. Close the Validation Result page and then click Next to finish your agent creation process.
- If failed to deploy the Prometheus configuration, a Validation Result page will be displayed with possible solutions.

Heapster metric collector

Enter the existing Heapster service namespace and name to configure the metrics collector.

i IMPORTANT: Deploy the Heapster service to your cluster manually before creating an agent with Heapster as metric collector. Otherwise, connection test to your Heapster service will fail, and you cannot proceed to the next step.

Create Docker Agent				×
✓ Agent Manager	Heapster Config	juration Card		
✓ Agent Properties	Please enter Hea	pster service information.		
✓ Credential	Namespace	kube-system	Θ	
 Metrics Collector 	Name	heapster	0	
Heapster Configuration Card				
• Summary				

8 Summary: click Finish.

	Lockbox	System	
	New or Existing Credential	New	
	Lockbox Password	The Lockbox is not a password secured Lockbox.	

9 Then, the agent will be created and activated automatically.

Creating and Activating a Docker Swarm Agent

Each Docker Swarm Agent monitored one docker host. If the docker host belongs to a Docker Swarm cluster, it will be considered as a manager/worker node. Otherwise, it will be considered to be a standalone docker host.

NOTE: For a Docker Swarm cluster, you should create one Docker Swarm Agent for one host in the cluster, and if you want to monitor the whole cluster environment, you need to create all the Docker Swarm Agents for all the hosts in the cluster.

To create a Docker Swarm agent on a monitored host:

- 1 Login in to the Foglight browser interface and make sure the left navigation panel is open.
- 2 On the navigation panel, under **Dashboards**, click **Administration > Agents > Agent Status**.

The Agent Status dashboard opens.

3 In the Agent Status dashboard, click Create Agent.

The Create Agent wizard opens.

- 4 *Host Selector*: Select the monitored host that you want to monitor with the Docker Swarm agent instance that you are about to create, and then click **Next**.
 - **NOTE:** In order to select the host, the Foglight Agent Manager must be installed and running on the monitored host.
- 5 Agent Type and Instance Name: Specify the following values, and then click Next.
 - Agent Type: Select DockerSwarmAgent from the agent type list.

- Agent Name: Specify the name of the agent instance that you are about to create using either of the following approaches:
 - Generic Name: This option is selected by default. A generic name is a combination of the host name and the agent type and uses the following syntax: agent type@host name.
 - Specify Name: Type that name in the Name field. For example, MyAgent.
- 6 On the Summary page, review the choices you have made, and then click Finish.

The Agents table refreshes automatically, showing the new Docker Swarm Agent.

- 7 On the *Agents* table, select the Docker Swarm Agent that you create, click **Edit Properties**, and then click **Modify the private properties for this agent**.
- 8 In the *Agents* properties view, check if the following values have been configured based upon your environment:

Name	Host		Туре	Tags
testagent		0	DockerSwarmAgent	
This agent is currently using prop K Modify properties for this age K Modify the properties for all D				
Configuration				
Name	docker			
Host Name	localhost			
Docker Remote API End Point	THE CONTRACTOR STREET			
Swarm				
Swarm Name	default			
Data Collection Scheduler				

- Name: give a name to the monitored docker host, it should be unique.
- Host Name: IP address or host name of the monitored docker host.
- Docker Remote API End Point: Docker Remote API endpoint of the monitored docker host. For more information, see Enabling Docker Remote API for monitored docker host on page 17.
- Swarm Name: specify the swarm cluster name for display. If the swarm name is kept as "default", then the cluster name will be displayed as "default (cluster ID)" on the dashboard. If a customized name is input here, then the customized cluster name will be displayed on the dashboard.
- **NOTE:** Ensure that the docker host inside the same cluster has the same configuration for Swarm Name.
- 9 Return back to the Agents table, select the above property changed Docker Swarm Agent, and then click Activate.

The new Docker Swarm Agent is created and data will be shown on the **Monitoring** tab after a few minutes.

Configuring data collection interval

The default data collection interval of agents is set to 5 minutes by default. Foglight for Container Management enables you to change this collection interval as needed.

i NOTE: Changing the data collection interval will take effect for all Kubernetes agents and Docker Swarm agents.

To configure the data collection interval:

1 On the navigation panel, under **Dashboards**, select **Administration > Agents > Agent Status**.

- 2 On the *Agent Status* dashboard, select the Kubernetes agent that you use to monitoring the container environment, and then click **Edit Properties**.
- 3 In the *Edit Properties* dashboard, click **Edit** next to the *Collector Config* field.
- 4 In the KubernetesAgent or DockerSwarmAgent Collector Config dialog box, change the following values, as needed:
 - Inventory Collector: Specifies the interval for collecting components.
 - Metrics Collector: Specifies the interval for collecting metrics.
- 5 Click Save.

Kubernetes

Monitoring Kubernetes Clusters

Kubernetes cluster is a group of kubernetes resources. There are two kinds of nodes inside a cluster, Kubernetes master and Kubernetes nodes. Kubernetes master is responsible for maintaining the desired state of your cluster which Kubernetes node is responsible to run your application and cloud workflows. The *Kubernetes Cluster Quick View*, which appears after clicking **Monitoring > Clusters**, shows the data collected about the selected clusters and namespaces. This view consists of the following two panes:

- The **Kubernetes Clusters** tree view, which appears on the left of *Kubernetes Clusters Quick View*, lists the clusters existing in the monitored Kubernetes environment.
- The Kubernetes Clusters Summary view, which appears on the right after you select an individual cluster in the Kubernetes Clusters tree view.

Kubernetes Clusters Summary view

The Kubernetes Clusters Summary view appears on the right when you select a node in the Kubernetes Clusters tree view.

The Kubernetes Clusters Summary view displays the following data:

 Events: The events occur on the selected Kubernetes cluster over a selected period of time, which includes:

- The column chart on the left: Shows the timeline of the occurred events, which indicates at what time and how many events have occurred.
- The pie chart on the right- Event Sources: Shows the events distribution for different event source.
- Resource Utilizations: The resource utilization for the selected Kubernetes cluster over a selected period of time, which includes the following:
 - Top CPU Utilization by Node: shows the nodes that CPU Utilization are top N highest.
 - Top Memory Utilization by Node: shows the nodes that Memory Utilization are top N highest.
 - Top Network Transfer (Bytes) Rate by Node: shows the nodes that Network Transfer (Bytes) Rate are top N highest.
 - Top Disk I/O Load by Node: shows the nodes that Disk I/O Load are top N highest.
 - Q: The icon indicates this metrics is collected by Prometheus metrics collector.
- Summary: Displays the detailed information about the selected Kubernetes cluster, including Name, Version, Pods, Nodes, Deployments, Stateful Sets, Jobs, and Replica Sets.

Click **Explore** on the upper right of the **Kubernetes Clusters Summary** view to open the **Cluster Explorer** view, which shows more detailed information about this Kubernetes cluster.

Click **View Topology** on the upper right of the **Kubernetes Clusters Summary** view to open the Cluster Topology view, which shows the topology graph from the application accessible aspect.

Cluster Explorer view

The *Cluster Explorer* view opens when you click **Explore** in the Kubernetes Clusters Summary view, which includes the following tabs:

• *Metrics tab:* The *Metrics* tab displays a *Metric Selector* allowing you to choose the metrics to be plotted on this dashboard. Charts of *CPU Usage* and *Memory Usage* are presented by default.

Figure 3. Kubernetes Clusters Explorer view Metrics tab

- *Events tab*: The Events tab shows a Heat Map of the events occur in this cluster. Heat maps will be refreshed automatically when you change either of the following fields:
 - Topology Type: Indicates the Kubernetes components on which the event occurs, including Pod, Node, and Service.
 - Namespace: Use the namespaces to filter the events.

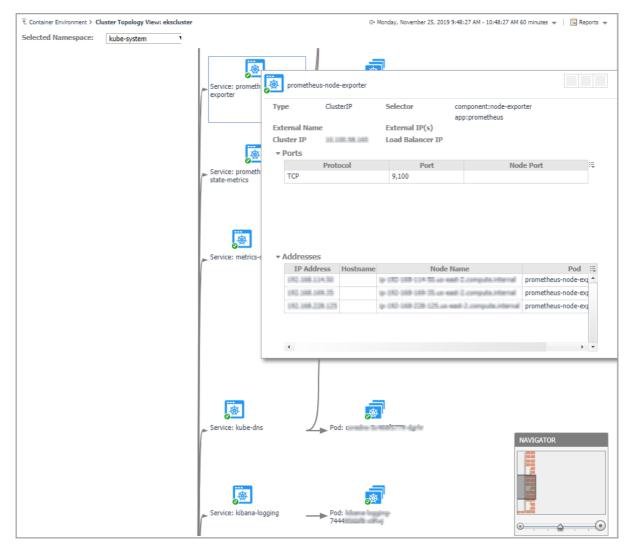

- *Type*: Indicates the severity of the event, including warning and normal.
- **i NOTE:** The color in the heatmap indicates the severity of component alarms. Green: indicates normal. Yellow: indicates warning. Orange: indicates critical. Red: indicates fatal.

Cluster Topology view

Figure 5. Kubernetes Clusters Topology view

The *topology* view visualizes the relationships between the objects from the pods accessible aspect in your environment through an interactive dependency map. The map illustrates how different components relate to each other, and the levels of the available resources available to them. Click on Pod, another sub topology view will popup to show the relationship from pods controller to storage for the selected Pod. Click other components or click the Pod inside the sub topology view, an information view will popup to show alarms, basic information, some metrics. From the information popup view of Pod, Node, and Cluster, click the Explore button will navigate to the explorer view of the selected Pod/Node/Cluster.

The **NAVIGATOR** in the bottom-right corner allows you to easily set the zoom level by dragging the slider into the appropriate position.

Monitoring Kubernetes Nodes

A node, previously known as a minion, is a worker machine in Kubernetes. A node may be a VM or physical machine, depending on the cluster. Each node has the services necessary to run pods and is managed by the master components. The *Kubernetes Nodes Quick View*, which appears after clicking **Monitoring > Nodes**, shows the data collected about the selected clusters and namespaces. This view consists of the following two panes:

- The **Kubernetes Nodes** tree view, which appears on the left of *Kubernetes Nodes Quick View*, lists the nodes existing in the monitored Kubernetes environment.
- The Kubernetes Nodes Summary view, which appears on the right after you select an individual node in the **Kubernetes Nodes** tree view.

Kubernetes Nodes Summary view

The **Kubernetes Nodes Summary** view appears on the right when you select a node in the **Kubernetes Nodes** tree view.

The Kubernetes Nodes Summary view displays the following data:

- *Resource Entitlement*: The resource allocation for the selected Kubernetes node over a selected period of time, which includes the following:
 - CPU Allocatable: Shows the current allocatable CPU resources of this node.
 - Memory Allocatable: Shows the current allocatable Memory resources of this node.
 - CPU Request and Limit: Shows the trend of CPU request, limit, and capacity of this node.
 - Memory Request and Limit: Shows the trend of Memory request, limit, and capacity of this node.
- *Resource Utilizations*: The resource utilization for the selected Kubernetes node over a selected period of time, which includes the following:
 - CPU Utilization: shows the percentage of CPU usage divide CPU capacity.

CPU Usage: shows the usage, request, and limit of CPU.

- Memory Utilization: shows the percentage of Memory usage divide Memory capacity.
 - Memory Usage: shows the usage, request and limit of Memory.
- Total Network I/O: shows the sending, receiving, and transferring rate in byte/s, aggregated from all interfaces.

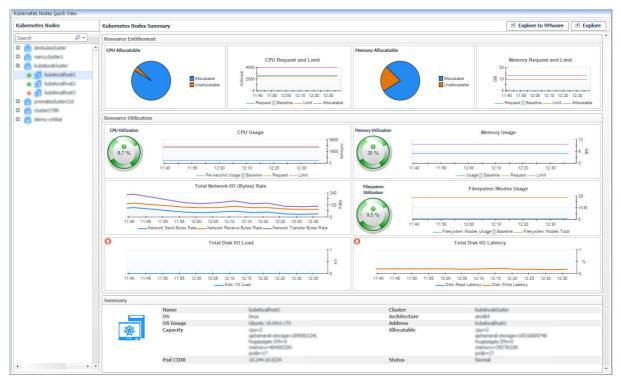

• Filesystem Utilization: shows the filesystem utilization.

Filesystem Inodes Usage: shows the inodes usage and total inodes.

- Total Disk I/O Load: shows the number of IOs in progress per second, aggregated from all disk devices.
- Total Disk I/O Latency: shows the read and write latency in percentage.
- Q: The icon indicates this metrics is collected by Prometheus metrics collector.
- Summary: Displays the detailed information about the selected Kubernetes node, including Name, Pod CIDR, OS, Architecture, OS Image, Address, Capacity, Allocatable, and Status.

Click **Explore** on the upper right of the **Kubernetes Nodes Summary** view to open the **Nodes Explorer** view, which shows more detailed information about this Kubernetes node.

Figure 7. Kubernetes Nodes Summary view for VMware

• *Explore to VMware VM*: Click the button to open the *VMware Explorer* view, which is the same view from VMware cartridge. The *Explore to xx* button varies from the cartridge that is monitoring the machines. Currently, the supported cartridges include: VMware, Infrastructure, AWS, and Azure.

Nodes Explorer view

The *Nodes Explorer* view opens when you click **Explore** in the Kubernetes Nodes Summary view, which includes the following tabs:

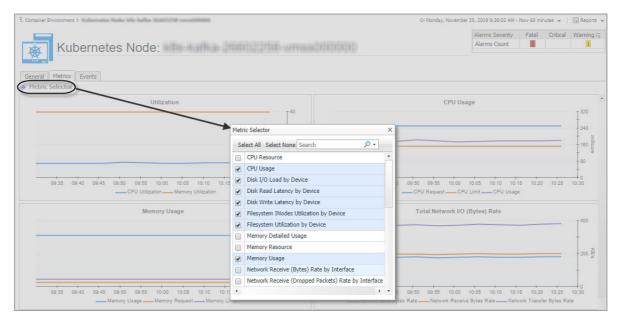

• *General tab:* The *General* tab displays the overall information of the selected Kubernetes node over a selected period of time, including the *Summary and Resource Information* table and the *Pods* table. For more information, see Node metrics on page 77.

Monitoring Kubernetes Workloads

Kubernetes workload is a group of Kubernetes resources. It includes the following Kubernetes resources types: deployment, daemon set, stateful set, replica set, replication controller, cron job, job, and pod. The *Kubernetes Workloads Quick View*, which appears after clicking **Monitoring > Workloads**, shows the data collected about the selected clusters and namespaces. This view consists of the following two panes:

- The Kubernetes Workloads tree view, which appears on the left of Kubernetes Workloads Quick View, lists the workloads existing in the monitored Kubernetes environment. The menu level differs from different workload types, following are some examples of the menu levels:
 - Cluster -> Namespace -> Deployment -> Replica Set -> Pod
 - Cluster -> Namespace -> Cron Job -> Job -> Pod
 - Cluster -> Namespace -> Daemon Set -> Job -> Pod
 - Cluster -> Namespace -> Stateful Set -> Pod
- The Kubernetes Pods Summary view, which appears on the right after you select an individual pod in the **Kubernetes Workloads** tree view.

Kubernetes Workloads Summary view

The **Kubernetes Workloads Summary** view appears on the right when you select a workload in the **Kubernetes Workloads** tree view.

The Kubernetes Workloads Summary view displays the following data:

- **NOTE:** If the selected workload type is a Pod, the metrics values are from the Pod. If the selected workload type is other than a Pod, then the metrics values are the aggregated values from all the related pods of the current workload (e.g. Deployment, Daemon Set, and so on).
- *Resource Utilizations*: The resource utilization for the selected Kubernetes Workloads over a selected period of time, which includes the following:
 - *CPU Utilization*: The CPU utilization is calculated as the percentage of CPU usage rate and limit, and it will be unset or blank if the CPU limit is not configured.

CPU Usage: A comparison of per-second usage, request, and limit.

 Memory Utilization: The Memory utilization is calculated as the percentage of memory usage and limit, and it will be unset or blank if the memory limit is not configured.

Memory Usage: A comparison of usage, request, and limit.

- Total Network I/O (Bytes Rate): transferring, sending, and receiving rate in bytes.
- · Filesystem Utilization: temporary filesystem utilization.

Filesystem Usage: temporary filesystem reading or writing rate in bytes.

- Summary: Displays the detailed information about the selected Kubernetes workload. The listed information might vary from different types of workload.
- Alarms: Displays the alarms aggregated from the pod and the current workload related to the pod.

Click **Explore** on the upper right of the **Kubernetes Workloads Summary** view to open the Workloads Explorer view, which shows more detailed information about this Kubernetes workload.

Workloads Explorer view

The *Workloads Explorer* view opens when you click **Explore** in the Kubernetes Workloads Summary view, which includes the following tabs:

- Metrics tab: The Metrics tab displays a Metric Selector allowing you to choose the metrics to be plotted on this dashboard. Charts of Utilization, CPU Usage and Quota, Memory Usage and Quota, Total Network I/O, Total Filesystem Usage, and Filesystem Utilization by Device are presented by default.
 - **i NOTE:** If the current workload is a Pod, then the metrics values are from the Pod. Otherwise, the metrics values come from aggregated values of the related pods of this workload (e.g. Deployment, Daemon Set).

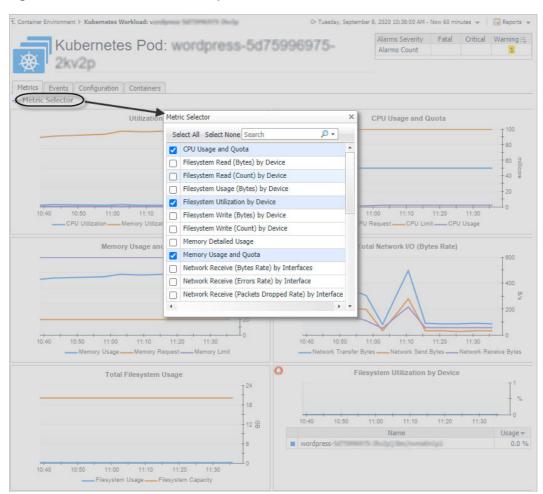

Figure 12. Kubernetes Workloads Explorer view Metrics Tab

- Events tab: The Event tab lists all the events occur on the workloads. It will not aggregate the alarms from
 other related workloads.
 - Name: name of the event.
 - Type: type of the event, Warning or Normal.
 - Namespace: namespace of where this event happens.
 - Involved Object: name of the Kubernetes component on which this event occurs.
 - Source: where this event has been triggered from.
 - Reason: reason of this event.
 - Message: detailed message of this event.

Monitoring Kubernetes Pods

A pod contains one or multiple containers, such as Docker containers, which contains storage/network and the specification about how to run the containers. The *Kubernetes Pods Quick View*, which appears after clicking **Monitoring > Pods**, shows the data collected about the selected clusters and namespaces. This view consists of the following two panes:

- The **Kubernetes Pods** tree view, which appears on the left of *Kubernetes Pods Quick View*, lists the pods existing in the monitored Kubernetes environment.
- The Kubernetes Pods Summary view, which appears on the right after you select an individual pod in the **Kubernetes Pods** tree view.

Kubernetes Pods Summary view

The **Kubernetes Pods Summary** view appears on the right when you select a cluster in the **Kubernetes Pods** tree view.

Figure 19. Kubernetes Pods Summary view

The Kubernetes Pods Summary view displays the following data:

- *Resource Utilizations*: The resource utilization for the selected Kubernetes Pod over a selected period of time, which includes the following:
 - *CPU Utilization:* shows the percentage of CPU usage divides CPU limit, if the limit is configured for this Pod.
 - CPU Usage: shows CPU usage rate, request, and limit, the trend of usage rate, as well as request and limit configuration.
 - Memory Utilization: shows the percentage of Memory usage divides Memory limit, if the limit is configured for this Pod.
 - Memory Usage: shows Memory usage, request, and limit, the trend of usage rate, as well as request and limit configuration.
 - Total Network I/O: shows the sending, receiving, and transferring rate.
 - Filesystem Utilization: shows the Filesystem utilization.
 - Filesystem Usage: shows the read and write rate in byte/s.
- Summary: Displays the detailed information about the selected Kubernetes Pod, including Name, Node, Cluster, Namespace, Owner, Pod IP, Service Account, DNS Policy, Restart Policy, and Status.

Click **Explore** on the upper right of the **Kubernetes Pods Summary** view to open the Pods Explorer view, which shows more detailed information about this Kubernetes cluster.

Pods Explorer view

The *Pods Explorer* view opens when you click **Explore** in the Kubernetes Pods Summary view. For detailed information for each tabs in Pods Explorer view, see Workloads Explorer view on page 36.

Monitoring Kubernetes Other Components

Kubernetes other components here including pods controllers, services, ingresses, persistent volumes, secrets and so on. All these components are grouped and displayed in tabs.

- Configurations
- Storage
- Load Balancer

The Configurations dashboard includes Kubernetes Secret and Config Map.

- A Kubernetes Secret is an object that contains a small amount of sensitive data, such as a password, a token, or a key. Such information might otherwise be put in a Pod specification or in an image; putting it in a Secret object allows for more control over how it is used, and reduces the risk of accidental exposure.
- A Kubernetes Config Map binds configuration files, command-line arguments, environment variables, port numbers, and other configuration artifacts to your Pods' containers and system components at runtime. Config maps allow you to separate your configurations from your Pods and components, which helps keep your workloads portable, makes their configurations easier to change and manage, and prevents hardcoding configuration data to Pod specifications.

The Kubernetes storage contains volumes, storage class, persistent volume, and persistent volume claim. Volumes are on-disk files used by the containers for persistent their data as well as sharing with other containers. The *Storage* dashboard shows the information about the following storage classes:

- Storage Class provides a way for the administrator to describe the "class" of storage they offer.
- *Persistent Volume* subsystem provides an API for users and administrators that abstracts details of how storage is provided from how it is consumed.
- *Persistent Volume Claim* is used for dynamic volume provisioning which allow storage volumes to be created on-demand.

The *Load Balancer* dashboard includes information about Kubernetes service, endpoint, and ingress. A Kubernetes ingress can provide load balancing, SSL termination, and name-based virtual hosting. A Kubernetes service is an abstraction which defines a logical set of pods and a policy by which to access them - sometime called micro-services. Kubernetes will update the endpoint whenever the set of pods in a service changes.

The *Alarms* dashboard displays a list of alarms generated against the monitored Kubernetes environment. Use this view to quickly identify any potential problems related to a specific Kubernetes component.

Capacity Management

Foglight for Container Management provide capacity management feature for Kubernetes. This feature uses historical data to predict the trend and usage within a specific future period.

- **NOTE:** If the Capacity Management tab is not displayed, ensure the following:
 - 1. You have purchased a license for Capacity Management. If not, contact Quest Support to purchase a license.
 - 2. You have the Container Administrator role.

🔅 Settings						
Resource Utilization			Recommendation			
Current Capacity	Current Performance		Usage Baseline for Fored	asting 30 days		
CPU 6.0 Core(s) Memory 20.4 GB	Memory Usage 5. CPU Request 1.	27.1 Millicore(s)/s 8 GB 7 Core(s) 0 GB	Resource CPU Memory	Add the	following within 30 days	i≣ 0 Millicore(s) 0.0 B

Growth Rate Per Week 213.2 Core(s)/s	Time To Full	140 Days	Growth Rate Per	r Week 304.9 B	Time To Full	> 1 Year

The Capacity Management dashboard contains the following fields:

- Setting: Click to change the following values:
 - Baseline for Forecasting: Defines the historical period used for the calculations of metric views, current capacity, and recommended resources in the Resource Utilization view. The default value is 60 Days Trending.
 - *Time Frame*: Defines the predicted period for calculating metric views, current capacity, and recommended resources in the Resource Utilization view. The default value is *Next 30 Days*.
- Resource Utilization:
 - Current Capacity: current resource capacity.
 - Current Performance: current resource usage.
- Recommendation:

In this section, it shows how many resources are recommended to be added in the current trend, so as to meet the predicated usage.

- Projected CPU/Memory Usage: Shows the historical data and the predicted usage trend within the configured future period.
- *Projected CPU/Memory Request:* Shows the historical data and the predicted request trend within the configured future period.
 - Utilization: usage.
 - Capacity: upper bound which the usage might reach.
 - Growth Rate per Week: growth amount of the resource.

- Time to Full: how many days the resource usage/request will reach the capacity.
- **NOTE:** If a value *Never* is displayed at *Time to Full*, which means the usage/request trend is declining and the usage/request will never reach the capacity.

Cost

Foglight for Container Management provide cost management feature for Kubernetes. The *Cost* view appears after clicking **Container > Kubernetes > Cost**. Currently, the Kubernetes costs for AKS and EKS environment are calculated.

NOTE: If the Cost tab is not displayed, ensure the following:
 1. You have purchased a license for Container Cost. If not, contact Quest Support to purchase a license.
 2. You have the Container Administrator role.

Prerequisites

Container cost does not collect costs from cloud providers, but uses the cost data collected by cloud agents for parsing the Container environment cost. The cost start date is the first date of the current month.

To use the cost data, ensure the following:

- For AKS cost, an Azure agent with the version 1.9.0 or above is required. The agent should be enabled to collect the inventory data of the AKS cluster resource group and that of the related infrastructure resource group, as well as the subscription cost related to the AKS cluster.
- For EKS cost, an AWS agent with the version 1.9.0 or above is required. The agent should be enabled to
 collect the regional inventory data related to the EKS cluster and the account cost related to the EKS
 cluster.
- **NOTE:** Cost metrics should be configured for cloud agents to collect cost data. Refer to the *Cost Tab* section in *Foglight Hybrid Cloud Manager User and Administration Guide* for detailed information.
 - The Kubernetes agent collects the inventory and metrics data. Otherwise, the cost data won't be displayed if there is no Kubernetes data on that day.
 - The clusters have been assigned to BUs. Otherwise, the clusters costs won't be displayed in Cost Dashboard.

Administration dashboard

Administration dashboard enables you to manage the relationships between your cluster and BU, configure budgets at cluster level, and view summarized information about cluster, BU, and cost.

You need to assign cluster to BU here in order to see cost metrics aggregated at different levels in Container Cost dashboards.

Business Units tab

Business Units tab enables you to manage your BU for your Organizations. You can create different BUs to manage your clusters.

Figure 25. Business Units tab

6) Co	ost dat	a will not be effected by the selected cluste	r on above.				
k	Kuberr	netes Administration					
_	Cluster	rs Business Units Delete Assign Organization			Search	0	
		Name A	Location	Organization	Search	Clusters	
		Foglight	n/a	Quest Organization		1	
	1.	Rainbow	n/a	Quest Organization		1	
	1	Unallocated	n/a	Default Organization		0	

The Business Units tab displays the following information:

- Name: BU name.
- Location: Geographic location of the BU.
- Organization: Organization of this BU.
- Clusters: numbers of the Kubernetes clusters that have been assigned to this BU.
- Add: Add a new Business Unit and assign it to a specific organization.
- Delete: Delete a Business Unit.
- Click the button to edit the information of this Business Unit.
- Assign Organization: click the button to assign Business Unit to another Organization.

Clusters tab

Kubernetes clusters are collected by Kubernetes agents. By default, clusters will not be assigned to any BU and do not have a default monthly budget.

i NOTE: For EKS cluster, Container cost will automatically detect the EKS cluster collected by AWS agent for the cluster. However, if different AWS agent collects the same EKS cluster resources, then you need to assign the AWS account for this cluster.

Figure 26. Clusters tab

Co	st data	will not be effected by	the selected cl	uster on al	bove.					
К	uberne	etes Adminis	tration							
	luster Set Bud	s Business U		nove from	Business U	Init 🗼 Assign AV	VS Account			
	Edit	Name	Business Unit	Platform	Spending	Monthly Budget	Last Month(Oct. 2020)	Month-to-Date(Nov. 2020)	Forecast(Dec. 2020)	Last Collected Date
	1	janh_ningle_vm	-	AKS			5 135.34	\$ 0.00	\$ 354.00	2020-10-26 🔞
	1	c ks	Foglight	EKS			\$ 79.94	\$ 35.05	6 83.77	2020-11-06 🔞
	1	JanCluster	Rainbow	AKS	~	6 220.00	6 250 15	6 83.37	6 247.80	2020-11-07 🚯

The Clusters tab displays the following information:

- Name: The name of the Kubernetes cluster.
- Business Unit: The name of the BU.
- *Platform*: AKS, EKS, or On-Prem. If Container cost failed to detect the AKS or ESK cluster, it will display On-Prem by default.
- Spending: The trend of cost spending.
- *Monthly Budget*: Monthly budget, which can be configured through *Set Budget*.
- Last Month (Month. Year): The cost of last month.
- Month-to-Date (Month. Year): The cost of current month.

- Forecast (Month. Year): The cost prediction for next month.
- Last Collected Date: The latest date till when the cost data is collected. It depends on the Last collected time from different platforms.

When mousing over the time, the start date and the end date of container cost collection are displayed.

- Set Budget: Set monthly budget for the cluster
- Assign Business Unit: Assign the cluster to a specific BU.
- Remove from Business Unit: Remove the cluster from the selected BU.
- Assign AWS Account: This button will be enabled for editing only when an EKS cluster is selected.
- Click the button to change the monthly budge for the cluster.

Kubernetes dashboard

The *Kubernetes* dashboard displays a *Cost Overview* and several cost breakdown charts. The cost breakdown charts vary when choosing All Organizations, a single organization, a single BU, or a single cluster.

Kubernetes Overview

Figure 27. Kubernetes Overview

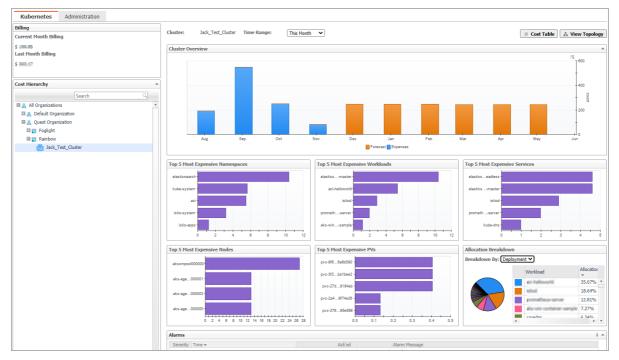

The Kubernetes overview shows the following information:

- *Time Range:* Enables you to change the time range for displaying the cost, including *This Month*, *Last Month*, or *Last N months*.
- Cost Overview: Monthly cost aggregated from all the clusters and the forecast aggregated cost for the continuing months.
- Cost Breakdown By Organizations: Cost categories by different organizations. Displayed when choosing All Organization.
- Cost Breakdown By Business Units: Cost categories by different BUs cross Organizations. Displayed when choosing All Organization or an organization.
- Cost Breakdown by Platforms: Cost categories by different platforms, such as AKS, EKS, and so on.
- *Most Expensive Clusters:* Displays the top N clusters that costs the most. Displayed when choosing an organization.

- Clusters Cost: Cost of the clusters of this BU. Displayed when choosing a BU.
- Alarms: all the cluster cost alarms. Currently we have over-budget alarm.

Cluster Overview dashboard

Figure 28. Cluster Overview

The Cluster overview dashboard shows the following information:

- *Time Range:* Enables you to change the time range for displaying the cost, including *This Month, Last Month*, or *Last N months*.
- *Cluster Overview*: The monthly cost aggregated from all the clusters of the organization and the forecast aggregated cost for the continuing months.
- Top 5 Most Expensive Namespaces: Displays the top 5 most expensive namespaces whose cost is aggregated from its workloads.
- *Top 5 Most Expensive Workloads*: Displays the top 5 most expensive workloads whose cost is aggregated from its related pods.
- Top 5 Most Expensive Services: Displays the top 5 most expensive services whose cost is aggregated from its related pods.
- Top 5 Most Expensive Nodes: Displays the top 5 most expensive nodes whose cost is collected from Azure or AWS.
- *Top 5 Most Expensive PVs*: Displays the top 5 most expensive persistent volumes whose cost is collected from Azure or AWS.
- Allocation Breakdown: Displays the Allocation Breakdown cost by Deployment or Stateful Set.
- Alarms: Displays all the cluster cost over-budget alarms.
- Cost Table button: Clicking the button will navigate to a Cost table grid layout dashboard.
- View Topology button: Clicking the button will navigate to a *Cluster Topology* View.

Cost Table

The Cost Table lists the detailed cost information calculated by different categories, including Infrastructure, Workload, and Service.

The Optimizer view includes the following elements:

- Settings. The Settings dialog box is used to change the time period and properties that are used for calculation. For more information, see Settings on page 51.
- Automate. Use the Automate menu to set the criteria for automatically sending recommendations for improvements. Currently, this button only functions for CPU and Memory when a VMware cluster is selected.
- Reclaim Now and Reclaim Later buttons. System administrator can select a VM from the list and review the Reclaiming Savings bar for information about how many resources can be reclaimed.
- **i NOTE:** The **Reclaim Now** and **Reclaim Later** buttons are enabled only after selecting a checkbox from the table. Currently, the two buttons only function for **VM Resources**, **CPU**, and **Memory** when a VMware cluster is selected.

The **Automate**, **Reclaim Now**, and **Reclaim Later** buttons are displayed only when a VMware cluster is selected.

- **Exclude** button. Select an object you want to exclude from the table to enable the Exclude button, and click Exclude. Then, this object is added to the list of excluded objects under a specific category.
- Show Excluded Items button. Click the Show Excluded Items button to view the excluded objects. The Settings dialog box appears. For more information, see Excluded tab on page 53.
- VM Resources/VM Resizing. Shows instance or virtual machine name, utilization, recommendations for both CPU and memory resources, and savings.
- CPU. Shows instance or virtual machine name, utilization, recommendations for CPU resource, and estimated savings.
- **Memory**. Shows instance or virtual machine name, utilization, recommendations for memory resource, and estimated savings.

- Storage. Shows virtual machine name, utilization, storage and modify recommendations, and savings.
- **i** NOTE: VM Resizing will be displayed when a cloud cluster is selected. VM Resources, CPU, Memory, and Storage will be displayed when a VMware cluster is selected.
 - Unused Resources table. Detects and shows those unused resources in container environment.

For example, persistent volume stays unused for more than 3 months. persistent volume stays in unbound status. This is due to the Unused Resources configuration in Settings.

 Potential Zombies table. Detects and shows the potential pod controllers in container environment, including Deployment, Daemon Set, Stateful Set, Replication Controller, as well as Pod that is not managed by any Pod Controller.

For example, if all pods managed by a pod controller are zombies, then we might suggest you to delete the whole pod controller.

Settings

Use the Settings menu to define the default optimization settings for your environment. The Settings Dialog box provides information about the following components:

- Configuration tab
- Waste tab
- Excluded tab
- Credentials tab
- Constraints tab

Configuration tab

Figure 32. Configuration tab

Save Can								Save Car

The Configuration tab provides the recommended settings for CPU, memory, and storage optimization.

- **Thresholds**. Provides the values of a resource metric that define the Warning and Critical levels (for CPU, memory, and storage).
- **Recommendation Calculation** area. Allows you to define the following parameters for optimizing the CPU, memory resources in your environment, Storage resources not supported at current version:

To save any changes made to the **Configuration** settings, click **Save** at the bottom of the tab.

Waste tab

Figure 33. Waste tab

ettings						
Configuration		aste Excluded		and Potential Zombies		
		Resource has been cr	reated 1	▼ Davs		- 0
		Persistent Volume Sta		Available		
				Released		
				Failed		
)etermine as a	potential zo	ombie if :	۷			
	Time per	riod used for average calculatio	n is 7	▼ Days		
	Average	resource utilization				
	100.0	Millicore/s for CPU	100.0	KB/s for Network		
	100.0	MB for Memory	100.0	MB for Filesystem		
	Excluded	Namespace				
	(c)					
					Save	Cancel

The **Waste** tab allows you to configure the settings for determining resources wasted in your environment. These include unused resources and potential zombie Pod controllers.

- Determine as waste if: used to filter Unused Resources.
 - Resource has been created [time] days: Resources that has been created more than the set days will be considered here.
 - Persistent Volume Status: By default, select Available and Failed. For detailed information, go to https://kubernetes.io/docs/concepts/storage/persistent-volumes/#phase.
- Determine as a potential zombie if: used to filter Potential Zombies.

In container environment, Potential Zombie Pod Controller is considered here, including Deployment, Daemon Set, Stateful Set, Replication Controller, and Pod that is not managed by any Pod Controller. Settings work for single pod managed by Pod Controller. If all pods or partial pods of a Pod Controller are considered as zombies, different recommendations will be generated.

- *Time period used for average calculation is [time] days*: The average metrics for the pods are calculated, so a time range should be set to calculate the average value.
- Average resource utilization: only if a pod's metrics satisfy all the conditions, it will be considered to be a potential zombie pod.
- Excluded Namespace: pods in the namespace can be excluded in the Potential Zombies check.

To save any changes made to the Waste settings, click Save at the bottom of the tab.

Excluded tab

Figure 34. Excluded tab

			>
Excluded Crea	dentials Co	onstraints	
Remove			: .
	Name	Туре	
	a print strategical	KubeDeployment	
	Remove	Excluded Credentials Co	Excluded Credentials Constraints

The **Excluded** tab allows you to remove a resource from the list of excluded objects. The **Excluded** tab includes the following information:

- On the left side, a navigation tree, that allows you to select the resource category.
- On the right side, the list of resources excluded from the selected category.

To remove resources from the list of **Excluded** objects, select the check boxes for these resources and click **Remove**. To save any changes made to the **Excluded** settings, click **Save** at the bottom of the tab.

The Excluded tab can also be accesses by clicking Show Excluded Items on the Optimizer tab.

Credentials tab

Figure 35. Credentials tab

Settings Dialog					>
Configuration	Waste	Excluded	Credentials	Constraints	
🕑 Add a New Cr	edential Group 🛛 🍯	Remove Credential G	roups	Search	<i>p</i> -
🗉 📄 😱 Optimize	Name 🔺 Storage-example		Administrator@	Credentials	

This tab is available in VMware environment. The **Credentials** tab allows you to add, edit, and remove credentials groups. This tab is only for the Storage rightsizer.

Constraints tab

Figure 36. Constraints tab

Settings Dialog							<i>.</i>		×
÷,					[*			
Configuration	Waste	Excluded	Crede	entials	Co	nstraints			
Add a New Co	onstraint Group 📔 🧲	Remove Constraint	Groups		Sea	rch		<i>p</i> -	
	Name 🔺		Min vCPU	Max vCPU	Min Memory	Max Memory	Min Storage	Max Storage	Γ
	Use the	above Add icon to ad	d one or m	ore Cred					

This tab is available in VMware environment. The **Constraints** tab allows you to set custom thresholds for select objects in the environment. These recommendations are displayed in the **Optimizer** tab > **VM Configuration/CPU/ Memory/ Storage** views > **Modify Recommendation** column. Use this tab to add, edit, and remove constraints groups.

i IMPORTANT: A virtual machine may have several partitions. VM environment makes recommendations for each partition separately, but the custom constraints can be set only for the entire VM (not for individual partitions). Therefore, the custom constraint for storage are applied to all partitions on the selected VM.

- i NOTE: The Administration dashboard can be accessed only when the users have both the Administrator role and the Container Administrator role. To grant the users with the Container Administrator role, go to Administration > Users & Security management under Administer Server > Manage Users, Groups, Roles > Roles tab.
- **IMPORTANT:** Heapster metrics collector is marked as Deprecated. Support for Heapster metrics collector will be removed in the future release. Users are encouraged to switch to the new Prometheus metrics collector.

The *Administration* dashboard supports new agent creation and existing agents management. It contains the following features:

- Create Agent task
- Remove Prometheus task
- Agents table

Create Agent task

Use *Create Agent* or the *Add* button to start a wizard to create a new agent. See Creating and Activating a Kubernetes Agent on page 19 for more information.

Remove Prometheus task

Remove Prometheus will start a wizard to remove the Prometheus successfully deployed through our platform.

i NOTE: Prometheus that are not deployed through our platform are not listed here.

nove Prometheus		
ou can remove Prometheus deployed from plat ollowing tables and click remove button to remo	form through this wizard. You can select ove them all.	Prometheus from multiple dusters in th
Agent Name 🔺	М	letrics Collector
Agent Name 🔺	Туре	Status
munitur Billmidto lutitar	Prometheus	Healthy

Select the Prometheus you want to remove and click Remove.

i NOTE: All the related Kubernetes components will also be removed according to the template that you used to deploy the Prometheus through our platform.

If the Prometheus service is deleted successfully, a result message will be display. Otherwise, the *Remove Prometheus* wizard will appear again with error messages to guide you with further operations. Follow the messages and delete them again later.

Agents table

Use Activate, Deactivate, Start Data Collection, Stop Data Collection, Delete, and Update Agent to manage the agent.

Metrics Collector

- Type: the type of Metrics Collector, supports Heapster, Prometheus, or OpenShift Prometheus.
- Status:
 - Healthy: discovered the Kubernetes service of the Metrics Collector and the result for the health check of the service is successful.
 - Unhealthy: discovered the Kubernetes service of the Metrics Collector, however, the result for the health check of the service is failed.
 - Discover failed: failed to discover the Kubernetes service in your cluster. The Deploy 🖾 icon is enabled.
 - Waiting for data update: waiting for status update after performing some operations for Metrics Collector.
 - Failed to update status: connection failed or other known issues. Contact the support.
- Migrate ↔: start a wizard to migrate Heapster to Prometheus Metrics Collector.

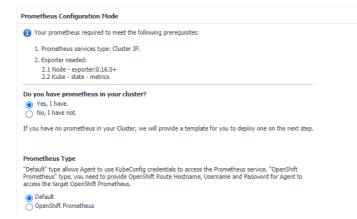

If the agent version is 3.0.0 and is using Heapster as the metric collector, you can Migrate from Heapster to Prometheus metrics collector.

• Deploy 🖾 : start a wizard to configure or guide to deploy Prometheus to your cluster.

If our platform failed to discover Prometheus in your cluster and the *Deploy* 🖾 icon is enabled.

Migrate or Deploy process

Clicking Migrate is or Deploy 🖾 will launch the Configure Prometheus Metrics Collector Wizard.

- Have existing Prometheus in your cluster.
- **NOTE:** Ensure that you have Prometheus in your cluster before this step. We will check the service existence and health status after you click Next.
 - Select the Prometheus Type.
 - Default type

Allows Agent to use KubeConfig credentials to access the Prometheus service. Enter the existing Prometheus service namespace and name to configure the metrics collector.

Prometheus Cor	nfiguration		
Please enter pror	netheus service information.		
Namespace	kube-system	0	
Name	prometheus-server	Θ	

 OpenShift Prometheus type: you need to provide OpenShift Route Hostname, Username, and Password for Agent to access the target OpenShift Prometheus.

1		theus uses Route Hostname to access the OpenShift OAuth secured I Hostname, Username and Password for Agent to access the target O	
Rout	e Hostname	https://promethesasikabe-system.mater-definalt.ass.alaste	0
Open	Shift Username	openshift	0
	Shift Password		0

NOTE: To find the Route Hostname, go to the **OPENSHIFT ORIGIN** dashboard, *Application* > *Routes*.

Your OpenShift Login User should have the privilege to access to the Prometheus.

Do not have existing Prometheus in your cluster.

A *Prometheus Configuration* wizard will appear. To configure the metrics collector, either use the default Prometheus template or upload your own Prometheus deployment .yml files through *Load from files*.

NOTE: Whenever you change the content in Configure file (template), ensure that the *Namespace* and *Name* fields are consistent with the Prometheus service configurations in your Configure file (template). If you are using the default template, there is need to change anything.

filesystem. Ensure	ometheus configuration file. If you have your own pro a that the namespace and the name of the Prometheu loaded. And then click Deploy to deploy prometheus.		
Configue file (template)	apiVersion: rbac.authorization.k8s.io/v1 kind: ClusterRoleBinding metadata: labels: app: prometheus component: server name: prometheus-server name: prometheus-server apiGroup: rbac.authorization.k8s.io kind: ClusterRole name: prometheus-server namespace: kube-system 	Load from files	
Namespace	kube-system	0	
Name	prometheus-server	0	

Reset from template: Helps you to reset the Configure file (template) content to the default template.

Deploy: Creates Prometheus components to your cluster with the Configure file. After clicking *Deploy*, a progress message will be displayed.

• If deployed successfully, a succeeded message will be displayed. Close the *Validation Result* page and then click **Next** to finish your agent creation process.

• If failed to deploy the Prometheus configuration, a *Validation Result* page will be displayed with possible solutions.

Agent Edit properties

Click in Properties column of the Agents table to edit the property of the agent.

• For agent using Heapster as metric collector, a wizard similar as below will be displayed. Update the agent properties and save the changes. A new data collection process will be initiated.

🙀 Kubernetes Agent [Monitor]: Edit Properties		×		
Cluster Name * :	2789Cluster	2789Cluster			
Kubernetes API Service End Point * :	https:///dompi2.am	DH0 (PAD and June Second) with			
Collected Event Level *:	ALL ABNOF	RMAL	θ		
Metrics Collector *:	Heapster				
	Service Namespace	kube-system	Θ		
	Service Name	heapster	0		
Ргоху	Enable Proxy		0		
			Save Cancel		

• For agent using Prometheus as metric collector and the Prometheus is successfully deployed through our platform, a wizard similar as below will be displayed.

👸 Kubernetes Agent [Monitor 🗐 🖬 🖬 🖬]: Edit Properties		>			
Cluster Name * :	ibmk8scluster		0			
Kubernetes API Service End Point * :	Https://id.huid2.com	https://di.houli2.containen.cloud.ibm.com.24067

Docker Swarm

The *Docker Container Quick View* appears after clicking **Monitoring > Containers**. Click **Swarm (Preview)** from the header on top to switch to Docker Swarm dashboard.

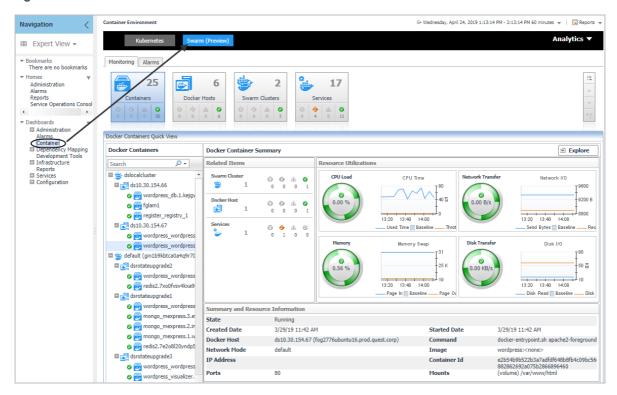

Figure 38. Docker Swarm Dashboard

Monitoring Docker Containers

This view consists of the following two panes:

- The Docker Containers tree view, which appears on the left of Docker Containers Quick View, lists the
 containers existing in the monitored Docker environment. The containers in the tree view are grouped by
 cluster > docker host > container.
- The Docker Container Summary view, which appears on the right after you select an individual container in the **Docker Containers** tree view.

Docker Container Summary view

The **Docker Container Summary** view appears on the right when you select a container in the **Docker Containers** tree view.

Figure 39. Docker Container Summary view

The Docker Container Summary view displays the following data:

- Related Items: Shows the related Docker components grouped by type as well as the associated alarms.
- *Resource Utilizations*: The resource utilization for the selected Docker Container over a selected period of time, which includes the following:
 - CPU Load: Shows the CPU utilization of the selected container.
 - CPU Time: Shows the used time and throttled time of the selected container.
 - Network Transfer: Shows the transfer bytes rate of the selected container over a selected period of time.
 - Network I/O: Shows the total send/receive bytes of the selected container.
 - Memory: Shows the memory utilization of the selected container.
 - Memory Swap: Shows the mounts of memory pages that are swapped to disk.
 - Disk Transfer: Shows the disk transfer bytes rate of the selected container over a selected period of time.
 - Disk I/O: Shows the disk read/write bytes of the selected container.
- Summary and Resource Information: Displays the detailed information about the selected Container, including State, Command, Created Time, Started Time, Image, and so on.

Click **Explore** on the upper right of the **Docker Container Summary** view to open the Container Explorer view, which shows more detailed information about this container.

Container Explorer view

The *Container Explorer* view opens when you click **Explore** in the Docker Container Summary view, which includes the following tabs:

Monitoring tab: The *Monitoring* tab displays the overall information of the selected container over a selected period of time, including the *Summary and Resource Information* table, Resource Management table as well as the Metrics list. To set the Metrics list displayed, go to **Action > General > Metric Selector**. For more information, see Container metrics on page 79.

Monitoring Docker Hosts

This view consists of the following two panes:

- The Docker Hosts tree view, which appears on the left of Docker Hosts Quick View, lists the docker hosts existing in the monitored Docker environment. The docker hosts in the tree view are grouped by cluster > docker host.
- The Docker Host Summary view appears on the right after you select an individual docker host in the **Docker Hosts** tree view.

Docker Host Summary view

The **Docker Host Summary** view appears on the right when you select a docker host in the **Docker Hosts** tree view.

Figure 41. Docker Host Summary view

The Docker Host Summary view displays the following data:

- Related Items: Shows the related Docker components grouped by type as well as the associated alarms.
- Resource Utilizations: The resource utilization for the selected docker host over a selected period of time, which includes the following:
 - CPU Load: Shows the CPU utilization of the selected docker host.
 - CPU Used: Shows the used CPU resources aggregated from the containers running on the docker host.
 - Network I/O and Network Transfer Rate: Shows the transfer bytes rate of the selected docker host
 aggregated from the containers running on the docker host over a selected period of time.
 - Memory and Memory Consumed: Shows the memory consumed bytes aggregated from the containers running on the docker host.
 - Disk I/O and Disk Transfer: Shows the disk transfer bytes rate of the selected docker host
 aggregated from the containers running on the docker host over a selected period of time.
- Summary and Resource Information: Displays the detailed information about the selected docker host, including Container Count by Status, Operating System, Memory Total, and so on.

Click **Explore** on the upper right of the **Docker Host Summary** view to open the Docker Host Explorer view, which shows more detailed information about this container.

Docker Host Explorer view

The *Docker Host Explorer* view opens when you click **Explore** in the Docker Host Summary view, which includes the following tabs:

- *Monitoring* tab: The *Monitoring* tab displays the overall information of the selected docker host over a selected period of time, including the *Summary and Resource Information* table, *Containers* table, *Images* table, and *Volumes* table.
 - **NOTE:** All the docker host metrics are calculated from the aggregated metrics of the containing containers on the docker host.

Figure 45. Docker Swarm Cluster Summary view

The Docker Swarm Cluster Summary view displays the following data:

- Related Items: Shows the related Docker components grouped by type as well as the associated alarms.
- *Resource Utilizations*: Shows CPU Utilization, Memory Utilization, Network Transfer Rate, Disk Transfer Rate metrics of the containers running in this docker swarm cluster in descending order.

Monitoring Docker Swarm Services

This view consists of the following two panes:

- The Swarm Services tree view, which appears on the left of Swarm Services Quick View, lists the docker swarm services existing in the monitored Docker environment.
- The Docker Swarm Service Summary view, which appears on the right after you select an individual docker swarm service in the **Swarm Services** tree view.

Docker Swarm Service Summary view

The Docker Service Summary view appears on the right when you select a docker swarm service in the Docker Services tree view.

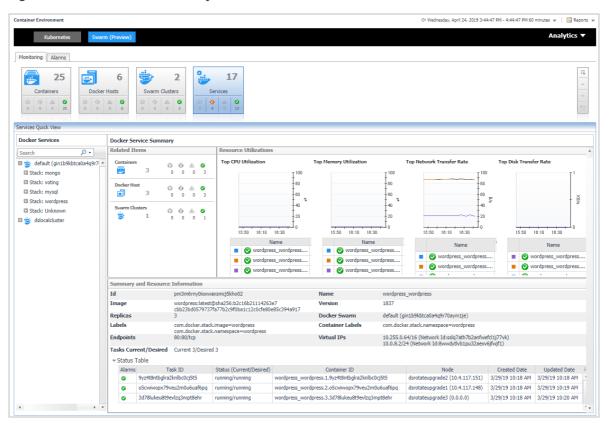

Figure 46. Docker Service Summary view

The Docker Service Summary view displays the following data:

- Related Items: Shows the related Docker components grouped by type as well as the associated alarms.
- Resource Utilizations: Shows CPU Utilization, Memory Utilization, Network Transfer Rate, Disk Transfer • Rate metrics of the containers running in this docker swarm service in descending order.
- Summary and Resource Information: Shows the summary information of the docker swarm service, . including Labels, Image, Mount Volumes, Ports, Container Status and so on.

Foglight for Container Management 6.1.0 User and Administration Guide Using Foglight for Container Management The *Alarms* dashboard displays a list of alarms generated against the monitored Docker environment. Use this view to quickly identify any potential problems related to a specific Docker component.

Analytics

Foglight for Container Management provide analytics feature for Kubernetes and Docker Swarm.

Heat Map is a two-dimensional representation of data in which values are represented by colors. Showing collected metrics with elaborate heat maps allows you to understand complex data sets and the monitored cluster environment well.

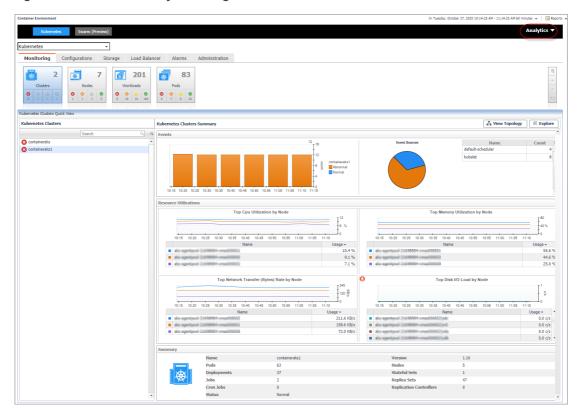

Scatter Plot is used to display values in points using two variables for a set of data. The points is color-coded also, Color Metric can be used to display one additional variable.

- Kubernetes analytics
 - Heatmap analytics
 - Scatter Plot analytics
- Docker Swarm analytics
 - Heatmap analytics
 - Scatter Plot analytics

Kubernetes analytics

In the Container dashboard, choose **Kubernetes** from the header. Then click **Analytics** from the header, a drop down view will display with **Heatmap** and **Scatter** on it. Click **Heatmap** will navigate to the Kubernetes **Heatmap Analytics** dashboard, while click **Scatter** will navigate to the Kubernetes **Scatter Plot Analytics** dashboard.

Heat maps will be refreshed automatically when you change either of the following fields:

- Topology Type: Indicates the monitored topology object, including Kubernetes Pod and Kubernetes Node.
- Cluster: Lists all clusters available in the monitored Kubernetes environment.
- Namespace: Lists all namespaces available in the monitored Kubernetes environment.
- Selected Metric: Populates a rectangle based upon the selected metrics. For example, if you select Memory Usage from the Selected Metric drop-down list, the rectangle area will be populated based on the used memory for the selected topology object. For more information about metrics, refer to Kubernetes metrics on page 75.
- Rendering related metrics: For example, if you select *CPU Usage Rate* and Red to Green, the rectangle of the topology object that has larger value of CPU Usage Rate will be rendered in red.
 - Color Metric: Renders the color of rectangle based upon the selected color metric.
 - Color Pattern: Offers two patterns, Red to Green (larger value shows in red) or Green to Red (larger value shows in green).

Figure 49 shows an example of heat map. Clicking the object name on the heat map directs you to the relevant object *Explorer* dashboard. For more information, see:

Docker Swarm analytics

In the Container dashboard, choose **Docker Swarm** from the header. Then click **Analytics** from the header, a drop down view will display with **Heatmap** and **Scatter** on it. Click **Heatmap** will navigate to the Docker Swarm **Heatmap Analytics** dashboard, while click **Scatter** will navigate to the Docker Swarm **Scatter Plot Analytics** dashboard.

Foglight for Container Management 6.1.0 User and Administration Guide Using Foglight for Container Management **71**

Heat maps will be refreshed automatically when you change either of the following fields:

- Topology Type: Indicates the monitored topology object, including Docker Container and Docker Host.
- Cluster: Lists all clusters available in the monitored Docker Swarm environment.
- Selected Metric: Populates a rectangle based upon the selected metrics. For example, if you select Memory Time Used from the Selected Metric drop-down list, the rectangle area will be populated based on the used CPU time for the selected topology object. For more information about metrics, refer to Docker Swarm metrics on page 79.
- Rendering related metrics: For example, if you select *CPU Utilization* and Red to Green, the rectangle of the topology object that has larger value of CPU Utilization will be rendered in red.
 - Color Metric: Renders the color of rectangle based upon the selected color metric.
 - Color Pattern: Offers two patterns, Red to Green (larger value shows in red) or Green to Red (larger value shows in green).

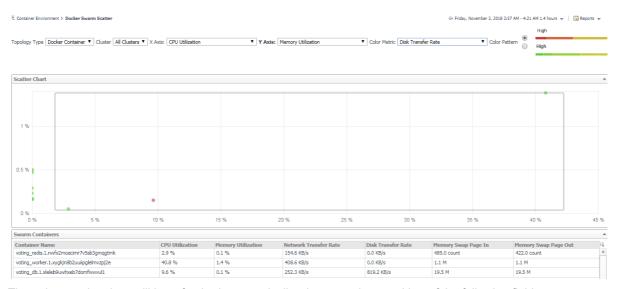

Figure 52 shows an example of heat map. This sample diagram represents the

"voting_redis.1.nwfx2moecimr7v5sb3gmqgtmk" has the maximum amounts of CPU Utilization which is the largest in size, and also it has the higher Memory Utilization since it is in Red. If you switch the Color Pattern, then "voting_redis.1.nwfx2moecimr7v5sb3gmqgtmk" will turn to green. Clicking the object name on the heat map directs you to the relevant object *Explorer* dashboard. For more information, see:

- Container Explorer view on page 62
- Docker Host Explorer view on page 63
- Container metrics on page 79

Scatter Plot analytics

Figure 53. Docker Swarm Scatter Plot Analytics Dashboard

The points on the chart will be refreshed automatically when you change either of the following fields:

- Topology Type: Indicates the monitored topology object, including Docker Container and Docker Host.
- Cluster: Lists all clusters available in the monitored Docker Swarm environment.
- X Axis: Indicates which metrics will be plotted on X axis.
- YAxis: Indicates which metrics will be plotted on Y axis.
- Rendering related metrics:
 - Color Metric: Renders the color of circle based upon the selected metrics.

Color Pattern: Offers two patterns, Red to Green (larger value shows in red) or Green to Red (larger value shows in green).

Figure 53 shows an example of Scatter Plot analytics. The purple circle in the middle represents the following: "voting_redis.1.nwfx2moecimr7v5sb3gmqgtmk" CPU Utilization is 2.9%, its Memory Usage is 0.1%, and its value of Network Transfer Bytes is not high. For more information, see:

- Container Explorer view on page 62
- Docker Host Explorer view on page 63
- Container metrics on page 79

Domains and Object Groups

Domains

A domain is a group of monitored components organized by monitoring technology. This dashboard shows a summarized view of your monitored enterprise organized by domain. Click on a sub-domain for detailed information about the contents and health of the domain.

To access the Domains dashboard, on the Navigation panel, click **Dashboards > Services > Domains**.

Click the + icon to display the components under Container.

Figure 54.	Container	Components	in	Domains	dashboard

Metrics

Kubernetes metrics

Workloads metrics

Table 4. Workloads metrics

Metric name	Description
CPU Usage Rate	CPU usage rate on all cores in millicores/second.
CPU Request	CPU request (the guaranteed amount of resources) in millicores.
CPU Limit	CPU hard limit in millicores.
CPU Utilization	Percentage of CPU usage / CPU limit if user configured CPU limit for this pod.
Memory Usage	Total memory usage in bytes.
Memory Working Set	Total working set usage. Working set is the memory being used and not easily dropped by the kernel.
Memory RSS	RSS memory usage.
Memory Cache	Number of bytes of page cache memory.
Memory Swap	Container swap usage in bytes.
Memory Request	Memory request (the guaranteed amount of resources) in bytes.
Memory Limit	Memory hard limit in bytes.
Memory Utilization	Percentage of Memory usage / Memory limit if user configured Memory limit for this pod.
Network Send Bytes Rate	Network send bytes per second.
Network Receive Bytes Rate	Network receive bytes per second.

Table 4. Workloads metrics

Metric name	Description
Network Transfer Bytes Rate	Network send and receive bytes per second.
Network Send Errors Rate	Network send errors count per second.
Network Receive Errors Rate	Network receive errors count per second.
Network Transfer Errors Rate	Network send and receive errors count per second.
Network Send Packets Rate	Network send packets count per second.
Network Receive Packets Rate	Network receive packets count per second.
Network Transfer Packets Rate	Network send and receive packets count per second.
Network Send Dropped Packets Rate	Network send dropped packets count per second.
Network Receive Dropped Packets Rate	Network receive dropped packets count per second.
Network Transfer Dropped Packets Rate	Network send and receive dropped packets count per second.
Filesystem Usage	Number of bytes that are consumed by the container on this filesystem.
Filesystem Capacity	Number of bytes that can be consumed by the container on this filesystem.
Filesystem Utilization	Percentage of Filesystem Usage / Filesystem Capacity.
Filesystem Read Bytes Rate	Filesystem read bytes per second.
Filesystem Write Bytes Rate	Filesystem write bytes per second.
Filesystem Read Rate	Filesystem read counts per second.
Filesystem Write Rate	Filesystem write counts per second.

i | NOTE:

- Workloads metrics are for the following workloads types, Deployment, Daemon Set, Stateful Set, Replica Set, Replication Controller, Cron Job, Job, and Pod.
- For workloads types except Pods, the metrics values come from the aggregated metrics values of the related Pods.

Container metrics

Table 5. Container metrics

Metric name	Description
CPU Usage Rate	CPU usage rate on all cores in millicores/second.
CPU Request	CPU request (the guaranteed amount of resources) in millicores.
CPU Limit	CPU hard limit in millicores.
CPU Utilization	Percentage of CPU usage / CPU limit if user configured CPU limit for this pod.
Memory Usage	Total memory usage in bytes.
Memory Working Set	Total working set usage. Working set is the memory being used and not easily dropped by the kernel.
Memory RSS	RSS memory usage.
Memory Cache	Number of bytes of page cache memory.
Memory Swap	Container swap usage in bytes.
Memory Request	Memory request (the guaranteed amount of resources) in bytes.
Memory Limit	Memory hard limit in bytes.
Memory Utilization	Percentage of Memory usage / Memory limit if user configured Memory limit for this pod.
Filesystem Usage	Number of bytes that are consumed by the container on this filesystem.
Filesystem Capacity	Number of bytes that can be consumed by the container on this filesystem.
Filesystem Utilization	Percentage of Filesystem Usage / Filesystem Capacity.
Filesystem Read Bytes Rate	Filesystem read bytes per second.
Filesystem Write Bytes Rate	Filesystem write bytes per second.
Filesystem Read Rate	Filesystem read counts per second.
Filesystem Write Rate	Filesystem write counts per second.

Node metrics

Table 6. Node metrics

Metric name	Description
CPU Usage Rate	CPU usage rate on all cores in millicores/second.
CPU Request	CPU request (the guaranteed amount of resources) in millicores.
CPU Limit	CPU hard limit in millicores.
CPU Utilization	CPU utilization as a share of node allocatable.
CPU Allocatable	Available CPU to allocate to workloads.
CPU Capacity	Hard CPU capacity of node.
Memory Usage	Total memory usage in bytes.
Memory Working Set	Total working set usage. Working set is the memory being used and not easily dropped by the kernel.
Memory RSS	RSS memory usage.
Memory Cache	Number of bytes of page cache memory.
Memory Swap	Container swap usage in bytes.
Memory Request	Memory request (the guaranteed amount of resources) in bytes.
Memory Capacity	Hard memory capacity of node.
Memory Limit	Memory hard limit in bytes.

Table 6. Node metrics

Metric name	Description
Memory Allocatable	Available Memory to allocate to workloads.
Memory Utilization	Memory utilization as a share of memory allocatable.
Network Send Bytes Rate	Network send bytes per second.
Network Receive Bytes Rate	Network receive bytes per second.
Network Transfer Bytes Rate	Network send and receive bytes per second.
Network Send Errors Rate	Network send errors count per second.
Network Receive Errors Rate	Network receive errors count per second.
Network Transfer Errors Rate	Network send and receive errors count per second.
Network Send Packets Rate	Network send packets count per second.
Network Receive Packets Rate	Network receive packets count per second.
Network Transfer Packets Rate	Network send and receive packets count per second.
Network Send Dropped Packets Rate	Network send dropped packets count per second.
Network Receive Dropped Packets Rate	Network receive dropped packets count per second.
Network Transfer Dropped Packets Rate	Network send and receive dropped packets count per second.
Filesystem Usage	Number of bytes that are consumed by the container on this filesystem.
Filesystem Capacity	Number of bytes that can be consumed by the container on this filesystem.
Filesystem Utilization	Percentage of Filesystem Usage / Filesystem Capacity.
Filesystem Inodes Usage	Number of Inodes that are consumed by the container on this filesystem.
Filesystem Inodes Total	Number of Inodes that can be consumed by the container on this filesystem.
Filesystem Inodes Utilization	Percentage of Filesystem Inodes Usage / Filesystem Inodes Capacity.
Filesystem Read Bytes Rate	Filesystem read bytes per second.
Filesystem Write Bytes Rate	Filesystem write bytes per second.
Filesystem Read Rate	Filesystem read counts per second.
Filesystem Write Rate	Filesystem write counts per second.

Docker Swarm metrics

Container metrics

Table 7. Container metrics

Metric name	Description
CPU Utilization	CPU utilization.
CPU Time Used	Total CPU time that a container used.
CPU Throttled Time	Total time that a container's CPU usage was throttled.
Memory Page Fault	Total page fault count of a container's Memory.
Memory Consumed	Total memory consumed of a container in bytes.
Memory Utilization	Memory utilization.
Memory PageIn Rate	Total page in count of a container's Memory.
Memory PageOut Rate	Total page out count of a container's Memory.
Disk Read Bytes	Total disk read bytes.
Disk Write Bytes	Total disk write bytes.
Disk Transfer Rate	Sum of total disk read and write bytes.
Network Send Packets	Total network send packets count.
Network Receive Packets	Total network receive packets count.
Network Send Bytes	Total network send bytes.
Network Receive Bytes	Total network receive bytes.
Network Inbound Dropped Packets	Total dropped packet count of all the packets coming into the container.
Network Outbound Dropped Packets	Total dropped packet count of all the packets going out from the container.
Network Transfer Rate	Sum of network send bytes and receive bytes per seconds during a specific period.

Rules

i NOTE: Foglight 6.0 uses Alarm Templates to gather alarm rules into a domain-specific template that is easily modified and applied to targets. Alarm rules can be modified using the Alarm Templates dashboard.

Foglight for Container Management allows you to create flexible rules that can be applied to complex interrelated data from multiple sources within your clusters. You can associate several different actions with a rule, configure a rule so that it does not fire repeatedly, and associate a rule with schedules to define when it should be evaluated or not.

Different types of data can be used in rules, including registry variables, raw metrics, derived metrics, and topology object properties.

There are two types of rules: simple rules and multiple-severity rules. A simple rule has a single condition, and can be in one of three states: *Fire*, *Undefined*, or *Normal*. A multiple-severity rule can have up to five severity levels: *Undefined*, *Fatal*, *Critical*, *Warning*, and *Normal*.

Rule conditions are regularly evaluated against monitoring data (metrics and topology object properties collected from your monitored environment and transformed into a standard format). Therefore, the state of the rule can change if the data changes. For example, if a set of monitoring data matches a simple rule's condition, the rule enters the *Fire* state. If the next set does not match the condition, the rule exits the *Fire* state and enters the *Normal* state.

Rules can be configured to send emails, pager messages, or perform other actions you define. Performance data can be viewed and analyzed using Foglight for Container Management.

Foglight for Container Management includes a number of predefined rules used to monitor the health of your container clusters. You are allowed to modify these rules to satisfy your different requirements. Many of these rules listed and described in this section have thresholds defined within them. Those thresholds include standard deviations, utilization percentages, and so on, are default values predefined in the registry.

For information on customizing alarms templates and rule, refera to Modifying alarms and threshold values and Customization.

Kubernetes

All rules are controlled by registry variable Kubernetes:AlertSensitivity. If the value is 0, then no alarm can be fired. If the value is 1, warning level alarm can be fired. If the value is above 1, then all level alarm can be fired.

Kubernetes Administrator email address can be configured in Registry Variable KubernetesAdmin.

Health Check

Kubernetes Pod Health Check

Purpose

This rule detects abnormal Pod health status and fires alarm for different severity abnormal health status.

Scope

KubePod

Conditions and Severities

Conditions	Severity	Action
Pods that is in Failed or Unknown status. Or the node which is running the pod gets disconnected.	Critical	Send email to Kubernetes Administrator.
Pods that is in CrashLoopBackOff status.	Warning	None

Kubernetes Pod Health Check (Pending Phase)

Purpose

This rule detects Pods that stays in pending phase for an abnormal long time.

Scope

KubePod

Conditions	Severity	Action
Pods that is pending for two continuous data submission periods because of Failed to schedule to Node.	Critical	Send email to Kubernetes Administrator.
Pods that is pending for two continuous data submission periods because container is not ready.	Warning	None

Kubernetes Container Health Check

Purpose

This rule detects abnormal Container health status and fires alarm for different severity abnormal health status.

Scope

KubeContainer

Conditions and Severities

Conditions	Severity	Action
Container that is terminated for abnormal reasons.	Critical	Send email to Kubernetes
		Administrator.

Kubernetes Node Health Check

Purpose

This rule detects abnormal Node health status and fires alarm for different severity abnormal health status.

Scope

KubeNode

Conditions and Severities

Conditions	Severity	Action
Nodes that is not Ready or out of disk or network unavailable.	Critical	Send email to Kubernetes Administrator.
Nodes whose memory or disk is under pressure.	Warning	None

Kubernetes Deployment Health Check

Purpose

This rule detects abnormal Deployment health status and fires alarm for different severity abnormal health status.

Scope

KubeDeployment

Conditions	Severity	Action
Deployment is not available.	Critical	Send email to Kubernetes Administrator.
Deployment has failed to create some of the replicated pods.	Warning	None

Kubernetes Daemon Set Health Check

Purpose

This rule detects abnormal Daemon Set health status and fires alarm for different severity abnormal health status.

Scope

KubeDaemonSet

Conditions and Severities

Conditions	Severity	Action
Some of the pods created by the Daemon Set is not available or mis-scheduled.	Critical	Send email to Kubernetes Administrator.
The daemon set doesn't have enough replicated pods running that meets its desired replicated pods count.	Warning	None

Kubernetes Job Health Check

Purpose

This rule detects abnormal Job health status and fires alarm for different severity abnormal health status.

Scope

KubeJob

Conditions and Severities

Conditions	Severity	Action
Job that is failed.	Warning	None

Kubernetes Persistent Volume Health Check

Purpose

This rule detects abnormal Persistent Volume health status and fires alarm for different severity abnormal health status.

Scope

KubePersistentVolume

Conditions	Severity	Action
Persistent Volume that is in failed status.	Warning	None

Kubernetes Persistent Volume Claim Health Check

Purpose

This rule detects abnormal Persistent Volume Claim health status and fires alarm for different severity abnormal health status.

Scope

KubePersistentVolumeClaim

Conditions and Severities

Conditions	Severity	Action
Persistent Volume Claim that is in failed status.	Warning	None

Kubernetes Persistent Volume Claim Health Check (Long Pending)

Purpose

This rule detects abnormal long pending Persistent Volume Claim and fires alarm for different severities.

Scope

KubePersistentVolumeClaim

Conditions and Severities

Conditions	Severity	Action
Persistent Volume Claim that is pending for two continuous	Critical	None
data submission periods.		

Kubernetes Container Restart for Termination with Invalid State

Purpose

This rule checks for container that restarted and previously terminated in an invalid state within the last 12 hours.

Scope

KubeContainer

Conditions	Severity	Action
Container that restarted and previously terminated in an	Critical	Send email to Kubernetes
invalid state within the last 12 hours.		Administrator

Usage

NOTE: All the Pod usage related rules are disabled by default, these rules are used as default values or examples for the customers to customize their different kinds of workloads. For how to customize the rules, refer to Customization on page 95.

Kubernetes Pod CPU Utilization

Purpose

This rule detects abnormal CPU Utilization for Pods, and fires alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities. This rule only works for those Pods that configures CPU limit.

Scope

KubePodCpu

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.	Fatal	Kubernetes:PodCpu UtilizationFatal	Send email to Kubernetes Administrator
Pods whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	Kubernetes:PodCpu UtilizationCritical	None
Pods whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	Kubernetes:PodCpu UtilizationWarning	None

*Note: the unit is percentage.

Kubernetes Pod Memory Utilization

Purpose

This rule detects abnormal Memory Utilization for Pods, and fires alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities. This rule only works for those Pods that configures Memory limit.

Scope

KubePodMemory

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.	Fatal	Kubernetes:PodMemory UtilizationFatal	Send email to Kubernetes Administrator
Pods whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	Kubernetes:PodMemory UtilizationCritical	None
Pods whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	Kubernetes:PodMemory UtilizationWarning	None

*Note: the unit is percentage.

Kubernetes Pod CPU Usage

Purpose

This rule detects abnormal CPU Usage for Pods, and fires alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubePodCpu

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is above the value configured in fatal Threshold.	Fatal	Kubernetes:PodCpu UsageFatal	Send email to Kubernetes Administrator
Pods whose usage is above the value configured in critical Threshold.	Critical	Kubernetes:PodCpu UsageCritical	None
Pods whose usage is above the value configured in warning Threshold.	Warning	Kubernetes:PodCpu UsageWarning	None

*Note: the unit is millicores/second.

Kubernetes Pod Memory Usage

Purpose

This rule detects abnormal Memory Usage for Pods, and fires alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubePodMemory

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is above the value configured in fatal Threshold.	Fatal	Kubernetes:PodMemory UsageFatal	Send email to Kubernetes Administrator
Pods whose usage is above the value configured in critical Threshold.	Critical	Kubernetes:PodMemory UsageCritical	None
Pods whose usage is above the value configured in warning Threshold.	Warning	Kubernetes:PodMemory UsageWarning	None

*Note: the unit is bytes.

Kubernetes Pod Network Receive

Purpose

This rule detects abnormal Network Receive Rate in bytes/second for Pods, and fire alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubePodNetwork

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is above the value configured in fatal Threshold.	Fatal	Kubernetes:PodNetwork ReceiveFatal	Send email to Kubernetes Administrator
Pods whose usage is above the value configured in critical Threshold.	Critical	Kubernetes:PodNetwork ReceiveCritical	None
Pods whose usage is above the value configured in warning Threshold.	Warning	Kubernetes:PodNetwork ReceiveWarning	None

*Note: the unit is bytes/second.

Kubernetes Pod Network Send

Purpose

This rule detects abnormal Network Send Rate in bytes/second for Pods, and fire alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubePodNetwork

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is above the value configured in fatal Threshold.	Fatal	Kubernetes:PodNetwork SendFatal	Send email to Kubernetes Administrator
Pods whose usage is above the value configured in critical Threshold.	Critical	Kubernetes:PodNetwork SendCritical	None
Pods whose usage is above the value configured in warning Threshold.	Warning	Kubernetes:PodNetwork SendWarning	None

*Note: the unit is bytes/second.

Kubernetes Pod Filesystem Utilization

Purpose

This rule checks kubernetes pod filesystem utilization to see if it reaches the defined threshold. The filesystem utilization rule only works for pod that configures filesystem limit.

Scope

KubePodStorage

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Pods whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.	Fatal	Kubernetes: PodFilesystemUtilization Fatal	Send email to Kubernetes Administrator
Pods whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	Kubernetes: PodFilesystemUtilization Critical	None
Pods whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	Kubernetes: PodFilesystemUtilization Warning	None

*Note: the unit is percentage.

Kubernetes Node CPU Utilization

Purpose

This rule detects abnormal CPU Utilization for Nodes, and fire alarm on different severities. It is enabled by default. You can change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubeNodeCpu

Conditions	Severity	Threshold (Registry Variable)*	Action
Nodes whose utilization is above the value configured in fatal Threshold.	Fatal	Kubernetes:NodeCpu UtilizationFatal	Send email to Kubernetes Administrator
Nodes whose utilization is above the value configured in critical Threshold.	Critical	Kubernetes:NodeCpu UtilizationCritical	None
Nodes whose utilization is above the value configured in warning Threshold.	Warning	Kubernetes:NodeCpu UtilizationWarning	None

*Note: the unit is percentage.

Kubernetes Node Memory Utilization

Purpose

This rule detects abnormal Memory Utilization for Nodes, and fire alarm on different severities. It is enabled by default. You can change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubeNodeMemory

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Nodes whose utilization is above the value configured in fatal Threshold.	Fatal	Kubernetes:NodeMemory UtilizationFatal	Send email to Kubernetes Administrator
Nodes whose utilization is above the value configured in critical Threshold.	Critical	Kubernetes:NodeMemory UtilizationCritical	None
Nodes whose utilization is above the value configured in warning Threshold.	Warning	Kubernetes:NodeMemory UtilizationWarning	None

*Note: the unit is percentage.

Kubernetes Node Network Receive

Purpose

This rule detects abnormal Network Receive Rate in bytes/second for Nodes, and fire alarm on different severities. It is enabled by default. You can change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubeNodeNetwork

Conditions	Severity	Threshold (Registry Variable)*	Action
Nodes whose utilization is above the value configured in fatal Threshold.	Fatal	Kubernetes:NodeNetwork ReceiveFatal	Send email to Kubernetes Administrator
Nodes whose utilization is above the value configured in critical Threshold.	Critical	Kubernetes:NodeNetwork ReceiveCritical	None
Nodes whose utilization is above the value configured in warning Threshold.	Warning	Kubernetes:NodeNetwork ReceiveWarning	None

*Note: the unit is bytes/second.

Kubernetes Node Network Send

Purpose

This rule detects abnormal Network Send Rate in bytes/second for Nodes, and fire alarm on different severities. It is enabled by default. You can change value of the registry variables or use your own value to change the threshold of each severities.

Scope

KubeNodeNetwork

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Nodes whose utilization is above the value configured in fatal Threshold.	Fatal	Kubernetes:NodeNetwork SendFatal	Send email to Kubernetes Administrator
Nodes whose utilization is above the value configured in critical Threshold.	Critical	Kubernetes:NodeNetwork SendCritical	None
Nodes whose utilization is above the value configured in warning Threshold.	Warning	Kubernetes:NodeNetwork SendWarning	None

*Note: the unit is bytes/second.

Kubernetes Node Network Transfer

Purpose

Periodically check Kubernetes node Network Transfer Rate in bytes/second, if the value is too high and changes too much, then an alarm will be triggered.

Scope

KubeNodeNetwork

Conditions	Severity	Threshold (Registry Variable)*	Action
Nodes whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.		Kubernetes: NodeNetworkTransferFat al	Send email to Kubernetes Administrator
Nodes whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	Kubernetes: NodeNetworkTransferCriti cal	None
Nodes whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	Kubernetes: NodeNetworkTransferWar ning	None

*Note: the unit is bytes/second.

Kubernetes Node Filesystem Utilization

Purpose

Periodically check Kubernetes node Filesystem Utilization, if the value is too high and changes too much, then an alarm will be triggered.

Scope

KubeNodeFilesystem

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Nodes whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.		KubeNodeFilesystemUtili zationFatal	Send email to Kubernetes Administrator
Nodes whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	KubeNodeFilesystemUtili zationCritical	None
Nodes whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	KubeNodeFilesystemUtili zationWarning	None

*Note: the unit is percentage.

Kubernetes Container CPU Utilization

Purpose

This rule checks Kubernetes container CPU utilization to see if it reaches the defined threshold. The CPU utilization rule only works for container that configures CPU limit.

Scope

KubeContainerCpu

Conditions	Severity	Threshold (Registry Variable)*	Action
Containers whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.		Kubernetes:ContainerCpu UtilizationFatal	Send email to Kubernetes Administrator
Containers whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.		Kubernetes:ContainerCpu UtilizationCritical	None
Containers whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	•	Kubernetes:ContainerCpu UtilizationWarning	None

*Note: the unit is percentage.

Kubernetes Container Memory Utilization

Purpose

This rule checks Kubernetes container Memory utilization to see if it reaches the defined threshold. The Memory utilization rule only works for container that configures Memory limit.

Scope

KubeContainerMemory

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Containers whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.		Kubernetes: ContainerMemoryUtilizati onFatal	Send email to Kubernetes Administrator
Containers whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.		Kubernetes: ContainerMemoryUtilizati onCritical	None
Containers whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.		Kubernetes: ContainerMemoryUtilizati onWarning	None

*Note: the unit is percentage.

Container Cost Cluster Budget Over Spending

Purpose

Detecting container cluster whose budget is over spending.

Scope

AbstractKubernetesClusterCost

Conditions	Severity	Threshold (Registry Variable)*	Action
Cluster current month cost which is about to reach the limit, the ration is above the value configured in fatal Threshold.	Fatal	ContainerCost:OverBudg etFatal ContainerCostAdmin	Send email to Kubernetes Administrator
Cluster current month cost which is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	ContainerCost:OverBudg etCritical	None
Cluster current month cost which is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	ContainerCost:OverBudg etWarning	None

*Note: the unit is percentage.

Docker Swarm

All rules are controlled by registry variable Docker:AlertSensitivity. If the value is 0, then no alarm can be fired. If the value is 1, warning level alarm can be fired. If the value is above 1, then all level alarm can be fired.

Docker Swarm Administrator email address can be configured in Registry Variable Docker:DockerAdmin.

Health Check

Docker Container Status

Purpose

This rule detects abnormal Container health status and fires alarm for different severity abnormal health status.

Scope

DockerContainer

Conditions and Severities

Conditions	Severity	Action
Container that is already stopped for abnormal reason.	Critical	Send email to Docker
		Swarm Administrator

Docker Container Status - Paused

Purpose

This rule detects abnormal long-time paused Container and fires alarm for different severity abnormal health status.

Scope

DockerContainer

Conditions	Severity	Action
Container paused for two continuous data submission periods.	Warning	None

Docker Service Status

Purpose

This rule detects abnormal Docker Swarm Service health status and fires alarm for different severity abnormal health status.

Scope

DockerService

Conditions and Severities

Conditions	Severity	Action
Missing some of the replicated task running for this	Critical	Send email to Docker
service.		Swarm Administrator

Docker Task Status

Purpose

This rule detects abnormal Docker Swarm Task health status and fires alarm for different severity abnormal health status.

Scope

DockerTask

Conditions and Severities

Conditions	Severity	Action
Task that is in failed, orphaned or remove status.	Critical	Send email to Docker Swarm Administrator

Docker Task Status -- pending

Purpose

This rule detects abnormal long-time pending Docker Swarm Task and fires alarm for different severity abnormal health status.

Scope

DockerTask

Conditions	Severity	Action	
Task that is in pending status for two continuous data	Warning	None	
submission periods.			

Usage

Docker Swarm Container CPU Utilization

Purpose

This rule detects abnormal CPU Utilization for Docker Swarm Containers, and fire alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities. This rule only works for those Containers that configures CPU limit.

Scope

DockerContainerCPU

Conditions and Severities

Conditions	Severity	Threshold (Registry Variable)*	Action
Container whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.	Fatal	Docker:ContainerCpu UtilizationFatal	Send email to Kubernetes Administrator
Pods whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	Docker:ContainerCpu UtilizationCritical	None
Pods whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	Docker:ContainerCpu UtilizationWarning	None

*Note: the unit is percentage.

Docker Swarm Container Memory Utilization

Purpose

This rule detects abnormal Memory Utilization for Docker Swarm Containers, and fire alarm on different severities. It is disabled by default. You can customize it and enable it based on your different requirements. For more details about customization, refer to Customization on page 95. You can also change value of the registry variables or use your own value to change the threshold of each severities. This rule only works for those Containers that configures Memory limit.

Scope

DockerContainerMemory

Conditions	Severity	Threshold (Registry Variable)*	Action
Container whose usage is about to reach the limit, the ration is above the value configured in fatal Threshold.	Fatal	Docker:ContainerMemory UtilizationFatal	Send email to Kubernetes Administrator
Pods whose usage is about to reach the limit, the ration is above the value configured in critical Threshold.	Critical	Docker:ContainerMemory UtilizationCritical	None
Pods whose usage is about to reach the limit, the ration is above the value configured in warning Threshold.	Warning	Docker:ContainerMemory UtilizationWarning	None

*Note: the unit is percentage.

Modifying alarms and threshold values

i IMPORTANT: Avoid editing rules in the Administration > Rules & Notifications > Rule Management dashboard. Default rules may be modified during regular software updates and your edits will be lost. Always use the Alarm Templates dashboard.

You can and should modify the thresholds associated with alarms to better suit your environment. If you find that alarms are firing for conditions that you consider to be acceptable, you can change the threshold values that trigger the alarm. You can also enable or disable severity levels to better suit your environment.

When a rule has severity levels, a Threshold section appears in the Alarm Settings tab showing the severity levels and bounds by agent. Many rules, such as Baseline rules, do not have severity levels and thresholds.

When editing thresholds, ensure that the new values make sense in context with the other threshold values. For most metrics, threshold values are set so that Warning < Critical < Fatal. However, in metrics where normal performance has a higher value, the threshold values are reversed: Warning > Critical > Fatal.

To change alarm status and threshold values:

- **i IMPORTANT:** The procedure below is a summary. Refer to **Viewing, Creating, and Managing Alarm Templates** in the *Foglight 6.0 User Guide* for more information on editing alarm templates for more information on working with alarm templates.
 - 1 In the Navigation panel, click Alarm Templates.
 - 2 If you have previously configured an alarm template, select that template.

Otherwise, click the Factory Template to view the default rules. Duplicate the factory template to make an editable copy, selecting the appropriate domains.

- 3 Click the appropriate domain tab.
- 4 Scroll or search to find the alarm rule you want to edit. Click the rule to select it.

Edit the rules using the procedure described in **Viewing**, **Creating**, **and Managing Alarm Templates** in the *Foglight 6.0 User Guide*

Customization

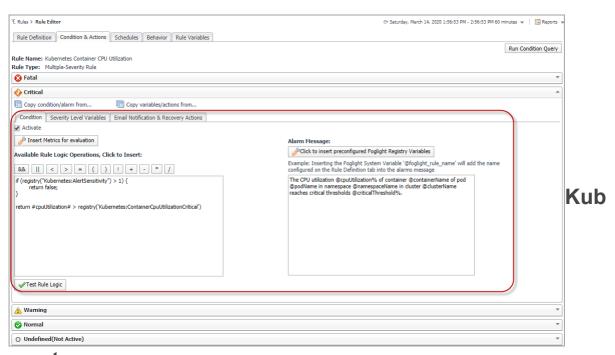

To customize a rule, Rule Scope and Condition will be used frequently.

To access Rule Scope and Condition, do the following:

- 1 Under **Dashboards**, click **Administration** > **Rules & Notifications** > **Rules**, then click on the rule and select *View and Edit*.
- 2 Click **Rule Editor** on the *Rule Detail* popup dialog box. Then click **Continue** on the *Confirm Edit Rule* popup dialog box.
- 3 On the **Rule Editor** dashboard, *Rule Scope* can be located on the **Rule Definition** tab and Condition can be located on the **Condition & Actions** tab.

ernetes

Filter Pods by Cluster

Finding Pods inside cluster "kubecluster", enter following statement in the Scope of a rule, and choose KubePod as the Topology Type in the Rule Scope.

KubePod where namespace.cluster.name='kubecluster'

Filter Pods by Namespace

Finding Pods inside namespace "default" of Cluster "kubecluster", enter following statement in the Scope of a rule, and choose KubePod as the Topology Type in the Rule Scope.

KubePod where namespace.cluster.name='kubecluster' and namespace.name='test'

Filter Nodes by Cluster

Finding Nodes inside cluster "kubecluster", enter following statement in the Scope of a rule, and choose KubeNode as the Topology Type in the Rule Scope.

KubeNode where cluster.name='nancyakscluster'

Filter Pod by Labels

Find Pods with labels "run=nginx" and "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose KubePod as the Topology Type in the Rule Scope.

KubePod where labels.key='run' and labels.value='nginx-rollingupdate' and labels.key='env' and labels.value='prod'

If you want to find Pods by labels in namespace "test" of cluster "kubecluster", you can append and namespace.cluster.name='kubecluster' and namespace.name='test' to the end of above statement.

Filter Node by Labels

Find Nodes with labels "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose KubeNode as the Topology Type in the Rule Scope.

KubeNode where labels.key='env' and labels.value='prod'

If you want to find Nodes by labels in cluster "kubecluster", you can append *and* cluster.name='kubecluster' to the end of above statement.

Filter Pod Metrics by Pod Labels

Find Pods Metrics with labels "run=nginx" and "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose KubeHeapsterMetrics as the Topology Type in the Rule Scope.

KubePod.metrics where object.labels.key='run' and object.labels.value='nginx' and object.labels.key='env' and object.labels.value='prod'

If you want to find Pods by labels in namespace "test" of cluster "kubecluster", you can append and namespace.cluster.name='kubecluster' and namespace.name='test' to the end of above statement.

Filter Nodes Metrics by Node Labels

Find Node Metrics with labels "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose KubeHeapsterMetrics as the Topology Type in the Rule Scope.

KubeNode.metrics where object.labels.key='env' and object.labels.value='prod'

If you want to find Nodes by labels in cluster "kubecluster", you can append *and cluster.name='kubecluster'* to the end of above statement.

Docker Swarm

Filter Container by Swarm Cluster

Find Containers in cluster "dockercluster", enter following statement in the Scope of a rule, and choose DockerContainer as the Topology Type in the Rule Scope.

DockerContainer where dockerSwarm.service.cluster.name='kicakdscluster'

Filter Container by Labels

Find Containers with labels "com.docker.stack.namespace=nginx" and "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose DockerContainer as the Topology Type in the Rule Scope.

```
DockerContainer where labels.key='com.docker.stack.namespace' and labels.value='nginx' and labels.key='env' and labels.value='prod'
```

If you want to find Containers by labels in cluster "swarmcluster", you can append *and dockerSwarm.service.cluster.name='kicakdscluster'* to the end of above statement.

Filter Docker Host by Swarm Cluster

Find Docker Hosts in cluster "dockercluster", enter following statement in the Scope of a rule, and choose DockerHost as the Topology Type in the Rule Scope.

DockerHost where dockerSwarmNodeInfo.node.cluster.name='kicakdscluster'

Filter Container CPU Usage by Container Labels

Find Container CPU Usage by container labels "com.docker.stack.namespace=nginx" and "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose DockerContainerCPU as the Topology Type in the Rule Scope.

DockerContainerCPU where container.labels.key='com.docker.stack.namespace' and container.labels.value='nginx' and container.labels.key='env' and container.labels.value='prod'

If you want to find Containers by labels in cluster "swarmcluster", you can append and container.dockerSwarm.service.cluster.name='kicakdscluster' to the end of above statement.

Filter Container Memory Usage by Container Labels

Find Container CPU Usage by container labels "com.docker.stack.namespace=nginx" and "env=prod" among all clusters, enter following statement in the Scope of a rule, and choose DockerContainerMemory as the Topology Type in the Rule Scope.

DockerContainerMemory where container.labels.key='com.docker.stack.namespace' and container.labels.value='nginx' and container.labels.key='env' and container.labels.value='prod'

If you want to find Containers by labels in cluster "swarmcluster", you can append and container.dockerSwarm.service.cluster.name='kicakdscluster' to the end of above statement.

About Us

Quest creates software solutions that make the benefits of new technology real in an increasingly complex IT landscape. From database and systems management, to Active Directory and Office 365 management, and cyber security resilience, Quest helps customers solve their next IT challenge now. Around the globe, more than 130,000 companies and 95% of the Fortune 500 count on Quest to deliver proactive management and monitoring for the next enterprise initiative, find the next solution for complex Microsoft challenges and stay ahead of the next threat. Quest Software. Where next meets now. For more information, visit https://www.quest.com/.

Technical support resources

Technical support is available to Quest customers with a valid maintenance contract and customers who have trial versions. You can access the Quest Support Portal at https://support.quest.com.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request.
- View Knowledge Base articles.
- Sign up for product notifications.
- Download software and technical documentation.
- View how-to-videos.
- Engage in community discussions.
- Chat with support engineers online.
- · View services to assist you with your product.
