About this Program Parameters Reference

This *Program Parameters Reference Guide* provides detailed specifications for all the program parameters ("INI" parameters) that you can use to fine-tune the behavior and performance of Migrator for Notes to Exchange applications. This *Reference* is intended for network administrators, consultants, analysts, and any other IT professionals who will use the product or participate in planning for a migration project.

The material here is organized to help you find pertinent information quickly, either by parameter keyname or by subject. The parameter definitions are divided into two primary sections: one for parameters that apply to Migrator for Notes to Exchange admin components, and the other for parameters that apply to the Self-Service Desktop Migrator (SSDM). Within each section, parameters are grouped by the [Sections] in which they appear, and are alphabetically sorted within each [Section].

If you want to know the meaning, syntax and uses of a particular parameter whose name you know, and you already know the [Section] in which it appears, you can simply look it up alphabetically by parameter keyname within the pertinent [Section]. If you don't know the [Section] you can look up the keyname in the *Index*.

If, on the other hand, you want to know which parameters pertain to a particular subject, consult the *Subject/Keyword Cross-Reference* table that immediately follows the SSDM parameters. For example, if you want to know which parameters control the processing of attachments, you can look up the keyword *attachment*, and there find a list of parameters that pertain to attachments.

Abbreviations used in this reference

In alphabetical order (by abbreviation):

AD Grps: AD Groups Provisioning Wizard
Collection: Collection Wizard
Data Loc: Notes Data Locator Wizard
Data Migr: Data Migration Wizard
Dir Exp: Directory Export Wizard
Doms Disc: Internet Domains Discovery Wizard
Log Vwr: Log File Viewer
NABs Disc: NABs Discovery Wizard
NMM: Notes Migration Manager
O365: Microsoft 365 Admin Account Pool Utility
PAB Replic: Send PAB Replicator Wizard
Prov: Provisioning Wizard
Q Sched: Notes Migration Scheduling Application
SSDM: Self-Service Desktop Migrator
Usr Stats: Self-Service Desktop Migration Statistics Collection Wizard

About the Migrator for Notes to Exchange documentation suite

This *Program Parameters Reference Guide* is one of several documents that explain various aspects of the Quest Migrator for Notes to Exchange product. The complete documentation suite includes:

- **Quick-Start Guide:** An orientation to Migrator for Notes to Exchange's basic purposes, components and features, with a case study to illustrate typical usage. Also includes instructions for downloading and installing the software.

- **Pre-Migration Planning Guide:** A checklist of strategic and tactical issues that an organization must consider and accommodate before beginning a migration project. An appendix also documents known limitations of the migration process.

- **Scenarios Guide:** Descriptions of the most common migration scenarios—migrating to different target environments and for an array of other variables and preferences—with process instructions and flow charts that explain how to use Migrator for Notes to Exchange tools and features in each scenario.

- **Administration Guide:** Operational details, application notes and screen-by-screen field notes for the administrator components of Migrator for Notes to Exchange.

- **Self-Service Desktop Migrator User Guide:** Operating instructions, application notes and screen-by-screen field notes for the Self-Service Desktop Migrator (SSDM) component of Migrator for Notes to Exchange. The *SSDM User Guide* is provided as a separate PDF document so that an administrator can distribute it to any end users who will run the per-desktop program.

- **Program Parameters Reference:** A listing of all Migrator for Notes to Exchange program parameters (and their valid values) in the Task Parameters and Global Defaults, and how to use them to control various program behaviors.

- **Online Help:** Context-sensitive field definitions and application notes for all the wizards and other component applications.

All these documents except the SSDM *User Guide* are intended for network administrators, consultants, analysts, and any other IT professionals who will install the product, use its admin tools, or contribute to migration project planning. Generally speaking, the *Pre-Migration Planning Guide* and *Scenarios Guide* present a more conceptual, theoretical view of the product, while the *Administration Guide* provides the hands-on, screen-by-screen descriptions and field notes. The SSDM User Guide is intended for end users or administrators who will use the Self-Service Desktop Migrator component.

> **i** **NOTE: Quest recommends** that all administrators read all the *Quick-Start Guide* and *Pre-Migration Planning Guide* (in that order), and the first chapter of the *Scenarios Guide*. You can use that information to prepare a detailed written Migration Plan before attempting the migration process.
>
> When you are ready to begin the migration process, you can refer to the process instructions and notes in the *Scenarios Guide* and the operational details in the *Administration Guide*.

Other sources of information

Visit our *Quest* online communities

The *Quest Communities* web site is an interactive online community dedicated to issues relating to:

- Migration of email, identity and applications to the Windows Exchange platform, either on-premises or hosted Exchange platforms like Microsoft 365—including migrations from Exchange, GroupWise, and Notes.

- Active Directory migrations.

- Migrations from Notes application and Exchange public folders to Sharepoint.

- Coexistence strategies and tools.

The community is designed to foster collaboration between Quest Migration experts and users. It's a place where you can:

• Learn about product releases and betas before anyone else.

• Get access to Quest product leaders and subject matter experts on migration and coexistence.

• Participate in discussion forums, share insights and ideas, and get common questions answered.

You can browse around the forums and the library, but to take full advantage of the community, post new threads, respond to messages from others, and rate our documents and downloads, you must *Join* the community. If you already have a Quest account or are a member of another Quest community, simply *Sign in*. The *Sign in* and *Join* features are both available from links near the top-right corner of the page at the Quest Communities web site.

- About language sections

Parameter scope: Global Defaults vs. Task Parameters

Program parameters for the administrator components of Migrator for Notes to Exchange exist in two forms:

- **Task Parameters:** parameters that apply to the operations of single specific tasks.
- **Global Defaults:** parameters that constitute the initial Task Parameters when a task is created, unless and until the Task Parameters are edited.

The Notes Migration Manager application maintains the Global Defaults in the SQL Server database and you can edit the Global Defaults to suit local circumstances and preferences. Each time a wizard creates a task, the wizard copies the entire set of Global Default parameters to the task definition where they become Task Parameters. You can edit the Task Parameters separately for each particular task.

The parameters for the Self-Service Desktop Migrator (SSDM) are saved and can be edited in an INI text file, *notesdtapp.ini*, which resides in the same path as the Self-Service Desktop Migrator application.

Parameter format and structure

Global Defaults, Task Parameters, and the parameters in the *notesdtapp.ini* file are edited the same way, as if all three sets of parameters were stored in INI files. The features that let you edit Global Defaults and Task Parameters copy the current parameter settings from the SQL Server database into a text document in Windows Notepad, so you can use the Notepad text-editing feature to change parameter values or add new parameter specifications. The full procedures are described in the following text. Since *notesdtapp.ini* is an INI text file, you can use Notepad or any other text editor to open the file and edit its contents.

Each parameter definition takes the form of a key name followed by an equals sign ("=") and the parameter value, like these examples:

```
Provider=quest
MigrationID=sitraka
User=proxyuser@sitraka.com
Force=1
ServerMailDest=PST
SelectedPstDir=c:\Program Files\Outlook\Archive
AllowAdd=1
```

Key names are case-insensitive and cannot contain spaces. Spaces can surround the equals sign and the spaces are ignored.

Upper/lowercase within a parameter value is significant only if case matters in whatever context the string will be inserted. For example, if you specified *CityName=**baLtImOre*** and the program forwards the parameter value to the user interface as a display element, the name appears in the same format as "baLtImOre."

Spelling of key names and parameter values is critical. If a program is looking for a key name *UserAddress*, it does not recognize a key name *UsreAddress* or *UserAdress*.

Program parameters are grouped into sections identified by section names enclosed within square brackets, such as:

    [ThisSection]
    KeyName1=blue
    KeyName2=654321
    KeyName3=kangaroo

    [ThatSection]
    KeyName4=Casablanca
    KeyName5=0

Sections are customarily separated by blank lines for improved readability. Section names are case-insensitive and may or may not contain any spaces.

GUI-set and other "auto-set" parameters

Many parameters are automatically set by an application to record entries in the graphical user interface (GUI). That is, an application writes the parameter value to the Task Parameters when an administrator or user makes an entry in the GUI. Other parameters are auto-set by the Setup program that installs the software or are auto-set by a program for internal controls.

> **!** | **CAUTION: Auto-set parameters are important to application performance, and changes to auto-set values can cause the associated applications to perform erratically. Quest strongly recommends that you do not manually edit the auto-set parameters except at the direction of Quest Support staff or if explicitly directed in application notes in this document.**

Transient "scratch" parameters

Many parameters are internal transient parameters, used by programs as temporary repositories for "scratch" data to pass information to another program, or from one subroutine to another. Any manual manipulation of these parameters is meaningless and has no affect on the program or data, since preexisting values are overwritten by the program when it runs. All transient "scratch" parameters are clearly identified as such in this document.

Parameter defaults

The default value of a required parameter is the value that was set when the software was installed by the Setup utility—before the associated program or anyone edited the file. The default value of an optional parameter is the value that prevails if the parameter does not appear in the INI file.

Parameter value data types

For any given parameter, the parameter value is meaningful only if it conforms to the parameter data type. Every parameter is one of these five data types:

- **String:** An alphanumeric string.
- **Integer:** A non-decimal numeric value.

- **Boolean:** A single-digit value, 1 or 0, to specify whether a particular feature or function is enabled or disabled, or whether a particular operating condition is true or false. These values are specified by a single-digit of 1 (on, yes, or true) or 0 (off, no, or false).

- **Date:** A date formed by eight digits with two slash characters in the form: mm/dd/yyyy.

- **Keyword:** An alphanumeric string that matches one of a finite set of valid keyword strings defined for the parameter.

How to specify or edit program parameters

Global Defaults, Task Parameters, and the parameters within the *notesdtapp.ini* file are all edited the same way, as if all three sets of parameters were stored in INI files. The features that let you edit Global Defaults and Task Parameters copy the current parameter settings from the SQL Server database into a text document in Windows' Notepad, so you can use the Notepad text-editing features to change parameter values or add new parameter specifications.

Since *notesdtapp.ini* is an INI text file, you can use Notepad or any other text editor to open the file and edit its contents.

To edit Global Defaults

In Notes Migration Manager:

1   Select **File** | **Global Default Settings**.

    The program opens the Global Default Settings in Windows Notepad. In Notepad, the settings appear as the contents of an INI file, but they are saved to the SQL Server database rather than as an INI file.

2   Find the pertinent [SectionName] for the parameter whose value you want to set or edit.

> ❗ | **IMPORTANT:** Some parameters in different sections share the same keyname, so it is important that you enter or edit parameter values in the correct sections.

3   Add the parameter or edit its value.

4   Repeat steps 2 and 3 as necessary to make additions and changes to the parameters.

5   Close Notepad.

    Notes Migration Manager copies the new parameter values into the SQL Server database.

To edit Task Parameters

In Notes Migration Manager, on the *View* menu, ensure the **Advanced Settings** check box is selected. This is a toggle setting that determines whether the wizard allows you open and edit Task Parameters. If the feature is enabled, a screen titled *Customize Configuration* is displayed in the wizard screen sequence that is controlled by Task Parameters.

In the *Customize Configuration* screen (in any wizard that offers it):

1   Click **Edit**.

    The wizard opens the task configuration settings in Windows Notepad. In Notepad, the settings look like the contents of an INI file, but they are saved as a part of the SQL Server database rather than as an independent INI file.

2   Find the [SectionName] for the parameter whose value you want to specify or edit.

> **!** **IMPORTANT:** Some parameters in different sections share the same keyname, so it is important that you enter and edit parameter values in the correct sections.

3   Add the parameter or edit its value.

4   Repeat steps 2 and 3 as necessary to make additions and changes to the parameters.

5   Close Notepad.

Notes Migration Manager copies the new parameter values into the SQL Server database.

To edit parameters in *notesdtapp.ini*

The parameters for the Self-Service Desktop Migrator (SSDM) are saved and can be edited in an INI text file, *notesdtapp.ini*, which resides in the same path with the Self-Service Desktop Migrator application. Since an INI file is a simple text file, use any text editor to open, view, and edit the file.

To edit notesdtapp.ini

1   Use Notepad or some other text editor to open the file.

2   Find the [SectionName] for the parameter whose value you want to specify or edit.

> **!** **IMPORTANT:** Some parameters in different sections share the same keyname, so it is important that you enter and edit parameter values in the correct sections.

3   Add the parameter or edit its value.

4   Repeat steps 2 and 3 to make additions and changes to the parameters.

5   Save the changed file and close the text editor.

About language sections

The Global Defaults, Task Parameters, and (for the SSDM) the *notesdtapp.ini* file contain parameter sections that specify the names that Migrator for Notes to Exchange will assign to the migrated Outlook mail folders in various languages.

For example, the section for the Japanese language [JPN] looks like this:

```
[JPN]
~INBOX= 受信トレイ
~SENT= 送信済みアイテム
~DRAFTS= 下書き
~TRASH= 削除済みアイテム
~CALENDAR= カレンダー
~CONTACTS= 連絡先
~JOURNAL= 履歴
~NOTES= メモ
~OUTBOX= 送信トレイ
~TASKS= タスク
```

By default, the Data Migration Wizard and SSDM read the Windows locale to determine the language for new Outlook folders, and refer to that language section of parameters when naming the new Outlook folders they create. However, you can specify a different language section.

The Global Defaults and *notesdtapp.ini* file contain sections for several common languages, and common variants of the world's primary languages—for example, French as spoken in France vs. Canada vs. Belgium vs. Monaco, etc. But the default program parameters do not include sections for many less common language variants.

The Global Defaults and *notesdtapp.ini* file do, however, contain sections for more generic forms of the world's primary languages, so if the wizard cannot find a section for a language variant associated with a particular locale, the wizard consults the more generic section. In Quebec, for example, if the wizard cannot find a section for [FRC] (Canadian French), it uses the folder names specified in [FR] (generic French).

Defining and selecting a language

If the default program parameters do not contain a section for the language variant associated with your locale, and if you do not want to use the more generic language alternative, you can create a new section for the language variant you want in the Global Defaults or *notesdtapp.ini*, or both.

You can create a local language section with a three-letter section name, such as ARY (Arabic Yemen). A table of Language three-letter acronyms (TLA) is shown in the following section. You can also create a generic language section with a two-letter section name that supports any local language that is identified by a TLA that starts with the same two letters. For example, you can create a new section for Arabic with an [AR] language section name. This section would support local languages such as ARY (Arabic Yemen) or ARQ (Arabic Qatar).

To enable MNE to use your new language section, you must specify the LanguageCode parameter. See [General] LanguageCode=<SECTIONNAME> on page 91 for the Admin version of this parameter. The value specified in the LanguageCode Admin or SSDM parameter must identify a section defined in the Global Defaults or *notesdtapp.ini*, respectively.

To use a language section with a TLA section name, the value of the LanguageCode parameter must be the same TLA. To use a generic language section, the value of the LanguageCode parameter can be the two-letter section name or a TLA that begins with the two-letter section name. So if you have defined a generic language section with the section name [AR], the LanguageCode values AR, ARY, ARQ, etc. would use this section.

Multiple target mail-folder names

Migrator for Notes to Exchange also supports multiple target mail-folder names to accommodate name differences introduced by Microsoft between different Exchange versions. Between Exchange 2010 and 2013, for example, Microsoft changed the English-language name of the junk mail folder from *Junk E-mail* to *Junk Email*. To define an additional folder name, you can append "_<version>" (e.g., _2010 or _2013) to the original folder name to create a new parameter key name (the portion of the parameter that precedes the "=" symbol).

For example, since the English 2013 version has a different junk mail folder name, you could use these parameters to define an additional English junk mail folder for 2013:

```
[EN]
~INBOX=Inbox
JUNKMAIL=Junk E-mail
JUNKMAIL_2013=Junk Email
```

The wizard creates a *Junk Email* target mail folder in an Exchange 2013 target server, or otherwise (for any other target) creates a *Junk E-mail* target mail folder.

The additional values supported in the current Migrator for Notes to Exchange release are:

```
_2010 for Exchange 2010
_2013 for Exchange 2013 or Microsoft 365 (with or without the MS AD sync provisioning option).
_2016 for Exchange 2016
_2019 for Exchange 2019
```

The language sections to define Outlook folder names are not included with the other Migrator for Notes to Exchange INI parameters that follow the TLAs table shown in the following section.

Custom folder mapping

The MNE Data Migration Wizard and SSDM support the migration of Notes custom folders and views to renamed target folders within one or more designated parent folders in Outlook. Custom naming of custom folders and views is accomplished by adding one or more custom-folder parameters to the language section of the Global Defaults, Task Parameters, and/or *notesdtapp.ini*.

The key-name portion of a custom-folder parameter must begin with the Outlook target folder name (as specified by the `[Notes] UserFolderPrefix` value for custom folders or the `[Notes] UserViewPrefix` values for custom views), followed by a backslash, and the name of the custom folder or view in the Notes source.

The key name is followed by the "=" symbol and the parameter value, the path you want to assign to the target custom folder in Outlook. For example:

```
[Notes]
UserFolderPrefix=Folders
UserViewPrefix=Views
[EN]
Folders\NotesFolderName=Folders\OutlookFolderName
Views\NotesViewName=Views\OutlookViewName
```

... tells MNE to create a new Outlook folder named OutlookFolderName within the Folders parent folder, and migrate the contents of the Notes folder NotesFolderName to the new Outlook folder.

Custom views are remapped in a similar fashion using the `[Notes]UserViewPrefix` setting. However, unlike custom folders, the custom view folder is only created in Outlook if content is migrated for the view (see the `MigrateViews` setting for details). If no content is migrated for the view, no view is created in Outlook.

Folder prefix mapping

You can override the `UserFolderPrefix` or `UserViewPrefix` folder names for specific custom folders or views by renaming the parent folder name to the right of the custom folder parameter. For example:

```
[Notes]
UserFolderPrefix=Folders
UserViewPrefix=Views
[EN]
Folders\NotesFolderName=RenamedFolders\OutlookFolderName
Views\NotesViewName=RenamedViews\OutlookViewName
```

Mapping to the root folder

If the parent folder is omitted from the parameter value (to the right of "="), the new folder is created at the same level as the Inbox. The same result can be achieved by leaving the `UserFolderPrefix` and/or `UserViewPrefix` settings blank. For example, this configuration:

```
[Notes]
UserFolderPrefix=Folders
UserViewPrefix=Views
[EN]
Folders\NotesFolderName=OutlookFolderName
Views\NotesViewName=OutlookViewName
```

would be equivalent to this configuration:

```
[Notes]
UserFolderPrefix=
UserViewPrefix=
[EN]
NotesFolderName=OutlookFolderName
NotesViewName=OutlookViewName
```

However, in the latter configuration all custom folders would be created at the root and in the former configuration, only the mapped folders would be created at the root.

[ActiveDirectory] section

[ActiveDirectory] ADAttribute=<AttributeName>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2

Specifies the AD attribute whose values the Data Migration Wizard should seek to match with values in the *SearchKey* column of a collection's data table, to match corresponding user accounts when using *LoadMethod=OtherFindAttribute* (explained below for the *LoadMethod* parameter in this same [ActiveDirectory] section). For example:

>   ADAttribute=userPrincipalName

[ActiveDirectory] AddADContainerPermission=<#>

Type:	Default:	Occurs in:	New in
boolean	1	NMM	4.16.1

This value corresponds to the GUI element in the Notes Migration Manager| Active Directory configuration screen, the **Automatically grant permissions** check box. This parameter is available only for an on-premises Exchange target and is selected by default.

MNE requires an AD administrative account that is a member of the Exchange Organization Management role group. When the target is on-premises Exchange and the check box is selected and applied, MNE tries the current login account. If the logged-on account does not have the required permissions, MNE displays a credentials window to request an account that has the required permissions. MNE checks to see if the specified AD account is a member of the Exchange Organization Management role group. If it is not, MNE automatically adds it to the role group and configures the account with remote PowerShell enabled.

Alternately, you can manually grant an account the AD container permissions in Exchange. Clear the **Automatically grant permissions** check box in the Active Directory configuration screen and enter the following PowerShell cmdlets:

>   Add-RoleGroupMember 'Organization Management' -member <UserAcct>

>   Set-User <alias> -remotepowershellenabled $true

[ActiveDirectory] ADProvisionAttempts=<#>

Type:	Default:	Occurs in:	New in:
integer	100	AD Grps (AD Group provisioning wizard)	4.16.1

This value specifies the maximum number of attempts that MNE MNE will try to create a new AD object during AD Group provisioning. This parameter is used to prevent timeout during provisioning when new AD objects cannot be created. This parameter should be used only at the direction of Quest support.

[ActiveDirectory] AlwaysUseDefaults=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager, the **Always use these values** check box in the *Active Directory Configuration* screen. The value determines whether the wizards that need this information always use the access credentials entered into the corresponding *AD Configuration* screen. For example, if:

>   AlwaysUseDefaults=1

... a wizard skips the screen that requests this information, saving the administrator the trouble of having to reenter the values and manually dismiss the screen. By default (*AlwaysUseDefaults=0*), the wizard takes the values entered in Notes Migration Manager as its defaults, but displays the screen to provide the option of accepting or changing the default credentials.

[ActiveDirectory] AlwaysUseOldAlias=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	AD Grps, Data Migr	4.1.6

Determines whether MNE keeps the `Alias/mailNickname` stamped onto an object in AD, rather than replacing that value with a value from Notes when provisioning groups and mailbox-enabling users. For example:

> AlwaysUseOldAlias=1

... keeps the value that was previously set on the AD object. By default (0), Migrator for Notes to Exchange overwrites the value previously set on the AD object.

[ActiveDirectory] AlwaysUseOldExchDn=<#>

Type:	Default:	Occurs in:	Default changed in:
boolean	0	AD Grps, Prov	4.1.6

Determines whether the legacyExchangeDN will be maintained through merging and mailbox-enabling, to support free/busy synchronization from Notes to Exchange through the Notes Connector. The feature is off (0) by default, for sites that do not require free/busy synchronization through the Connector. The feature can be enabled by:

> AlwaysUseOldExchDn=1

... to enable free/busy synchronization through the Connector.

[ActiveDirectory] Attr<#>=<AttributeName>

Type:	Default:	Occurs in:
string	[none]	Prov

Each *Attr<#>* parameter specifies a Contact attribute whose values the Provisioning Wizard will merge into the corresponding AD security object record, when the wizard merges the Contact into the object and deletes the Contact. You may define one or more *Attr<#>* parameters to specify one or multiple attributes whose data you want to carry into the merged object records. Example:

> [ActiveDirectory]
> Attr0=FirstAttributeName
> Attr1=SecondAttributeName
> Attr2=ThirdAttributeName

The digit(s) appended to an Attr<#> key name differentiate one parameter from another. Multiple Attr<#> parameters need not appear in numerical order, but must in aggregate form an uninterrupted numeric sequence and include *Attr0*.

[ActiveDirectory] Attribute=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	[GUI entry]	Prov, Data Migr

This value corresponds to a GUI element in the Provisioning Wizard, the Specify the Active Directory Attribute... drop-down list box in the Choose your method for finding objects screen. The wizard writes this value to the Task Parameters based on an administrator's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory] CanAddGroupMembers=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	AD Grps	3.2

When a member of a Notes/Domino group does not exist in AD, the AD Groups Provisioning Wizard will by default (CanAddGroupMembers=1) define a new AD contact for the group member, and add the contact as a new member to the corresponding AD group. To disable this feature:

>   CanAddGroupMembers=0

[ActiveDirectory] CanDeleteGroupMembers=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	AD Grps	3.2

Tells the AD Groups Provisioning Wizard to synchronize any previously provisioned group in AD to match the current state of the corresponding group in Notes. For example:

>   CanDeleteGroupMembers=1

... makes the membership list of a previously provisioned AD group match that of its Notes counterpart. By default (0), the wizard will leave any previously provisioned AD group unchanged.

[ActiveDirectory] CmnExcludeFromDirSync=extensionAttribute<##>

Type:	Default:	Occurs in:	New in:
keyword	extensionAttribute15	Dir Exp	4.4

If you are provisioning AD using the Quest CMN Directory Connector, this parameter specifies the AD attribute to use to control when merged and mailbox-enabled objects should synchronize back into Notes. (The parameter is ignored if you are provisioning by some other method.) The parameter value is a string consisting of *extensionAttribute* followed by one or two digits to designate the particular attribute. For example:

>   CmnExcludeFromDirSync=extensionAttribute15

The parameter defaults to *extensionAttribute15*, which is suitable as long as your organization is not already using extensionAttribute15 for some other purpose. If you are already using *extensionAttribute15* (and are using the CMN Directory Connector), change the parameter value to some other unused AD attribute. To disable this feature altogether (not use an AD attribute for this purpose), set *CmnExcludeFromDirSync=0*.

[ActiveDirectory] ContactFilter=<test>

Type:	Default:	Occurs in:	New in:
string	[none]	Prov	3.2

Defines a subexpression of a customized AD search query, to tell the wizard which AD contact objects to consider when merging AD objects with Notes objects (by matching AD attribute values with Notes attribute values in corresponding objects). This feature is useful in cases where two or more objects may carry the same value for the AD attribute, but the objects can be differentiated by some other attribute. The <test> value must be formatted as an AD query subexpression, including opening and closing parentheses, as in:

>   ContactFilter=(objectClass=contact)

The previous example requires each object's *objectClass* parameter value to be "contact." Conversely, the set to be considered can be defined by exclusion. For example, *ContactFilter=(!(objectClass=user))* tells the wizard to disregard any object whose *objectClass* parameter value is "user," but to consider all others.

[ActiveDirectory] CreateGroupDelay=<####>

Type:	Default:	Occurs in:	New in:
integer	0	Data Migr	4.1.8

Determines the number of seconds that the Data Migration Wizard, when group provisioning, will wait after deleting a contact (to make way for a group) before creating a distribution group in AD. You may want to set this value to something in the range of 30 to 300 seconds if your environment experiences AD replication delays. For example: *CreateGroupDelay=60*

If you experience no such delays, you may leave the parameter set to its default of 0 seconds (no delay).

[ActiveDirectory] CreateMailboxDelay=<#####>

Type:	Default:	Occurs in:	New in:
integer	0	Data Migr	4.1.2

Determines the time interval between two functions of the Data Migration Wizard mailbox-enabling process, which might otherwise cause PowerShell to generate incorrect aliases where Active Directory accounts are replicated among multiple servers. The wizard disables mail for an account before it creates the mailbox, but the mail-enabled account can appear to still exist for a few seconds on any servers where the account is replicated. When PowerShell sees a not-yet-disabled account on the other server, it mistakenly treats the new mailbox as a duplicate, appending the digit "1" to the alias to differentiate it from the other account.

If your AD accounts are replicated on multiple servers, and you experience the "Alias1" problem when enabling mailboxes, use the *CreateMailboxDelay* parameter to force a delay between the mail-disabling function and the mailbox creation to allow enough time for other servers to catch up and disable their replicated accounts.

The parameter value defines a delay in seconds in a valid range from 0 to 30000 and defaults to 0. For example:

        CreateMailboxDelay=15

... the wizard waits 15 seconds after mail-disabling an account before creating the associated mailbox. Quest in-house testing suggests the resolution of this problem might require a delay as long as 33 seconds, but often much shorter. Experiment with shorter values to determine the delay required in your own environment.

[ActiveDirectory] Domain=<domain.com>

Type:	Default:	Occurs in:
string	[none]	Data Migr

This value is auto-calculated from the AD Naming Context, from Active Directory. Quest recommends you do not manually enter or change this value except at the direction of Quest Support. For example:

        Domain=domain.com

[ActiveDirectory] DomainController=<domain.com>

Type:	Default:	Occurs in:
string	[GUI entry]	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Domain Controller host name text box in the *Active Directory Configuration* screen. The value specifies the PowerShell Domain Controller that Migrator for Notes to Exchange components will call to perform operations in a proprietary Exchange target (required if migrating to proprietary Exchange, irrelevant and ignored if migrating to Microsoft 365.) The program writes this value to the Task Parameters based on an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory] doX500Proxy=<# >

Type:	Default:	Occurs in:
boolean	1	AD Grps

Determines whether the legacyExchangeDN will be saved from contacts to groups and added as an X.500 proxyAddress while doing group provisionings.

[ActiveDirectory] EnableUsers=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Prov	4.1

This value corresponds to a GUI element in the Provisioning Wizard, the **Account is disabled** check boxcheck box in the *Specify Container for User Objects* screen. The wizard writes this value to the Task Parameters from an administrator's GUI entry. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

This parameter applies when migrating to an On-Premise Exchange or Microsoft 365 with **Use Azure Active Directory Synchronization**.

> EnableUsers=1

... tells the Provisioning Wizard that users newly created by the wizard (if `[Active Directory] ProvisionUsers=1`) should be logon-enabled. By default (1), any such newly created users are logon-enabled.

[ActiveDirectory] FindMethod=<value>

Occurs in: Prov. This is an internal scratch parameter (see Transient "scratch" parameters).

[ActiveDirectory] ForceAddress=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

If the Data Migration Wizard is mailbox-enabling and finds the primary SMTP address of an Active Directory entry to be different from the expected SMTP address, this *ForceAddress* parameter determines whether the wizard should change the AD entry to the primary SMTP address specified in the *targetAddress* column of the SQL Server database. For example, if:

> ForceAddress=0

... the wizard does not change the AD address entry to the expected SMTP address. The feature is set to (*ForceAddress=1*) by default.

[ActiveDirectory] GroupContactsContainer=<Container>

Type:	Default:	Occurs in:
string	[GUI entry]	NMM, AD Grps

This value corresponds to a GUI element in the Notes Migration Manager: the **Path to an existing OU for creating external members for distribution groups** text box in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The value here is a fully qualified domain name to identify the sub OU in AD where new Contacts will be created if *CanAddGroupMembers=1* (also in this [ActiveDirectory] section). For example:

> GroupContactsContainer=OU=Contacts,OU=Groups,CN=Users,DC=domain,DC=com

[ActiveDirectory] GroupFilter=<test>

Type:	Default:	Occurs in:	New in:
string	[none]	AD Grps	3.2

Defines a subexpression of a customized AD search query, to tell the wizard which objects to consider when searching for groups (or objects that represent groups) in Active Directory. This feature can be useful when two objects are located but one can be safely ignored because it doesn't interfere with provisioning, or the conflict can be resolved later. The <test> value must be formatted as an AD query subexpression, including opening and closing parentheses, as in:

        GroupFilter=(objectClass=group)

The above example requires each object's object-Class parameter value to be "group." Conversely, the set to be considered may be defined by exclusion, as in:

        GroupFilter=(!(objectClass=contact))

... which tells the program to disregard any object whose object-Class parameter value is "contact," but to consider all others.

[ActiveDirectory] GroupManagerCanUpdateMembershipList=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	AD Grps	4.8

Determines whether the Groups Provisioning Wizard will provision groups so that group managers who are not in Domain Admins can still update group membership. (This privilege corresponds to a check box in Active Directory: the *Manager can update membership list* check box in the *Managed By* tab of AD's Group Properties.) The feature is enabled by default (*GroupManagerCanUpdateMembershipList=1*), but you can set the value to 0 to tell Migrator for Notes to Exchange to not extend the updating privilege to group managers who are not in Domain Admins.

[ActiveDirectory] GroupsContainer=<ContainerFQDN>

Type:	Default:	Occurs in:	Revised in:
string	[GUI entry]	NMM, AD Grps	4.0

This value corresponds to a GUI element in the Notes Migration Manager: the Path to existing organizational unit for distribution groups text box in the *Active Directory Configuration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

In version 3.2 this parameter was named *GroupsRDN*, and could accept a relative domain name for the parameter value. The renamed parameter now requires a fully qualified domain name. For example:

        GroupsContainer=OU=Groups,CN=Users,DC=domain,DC=com

[ActiveDirectory] GroupsSearchFilter=<test>

Type:	Default:	Occurs in:	New in:
string	[none]	AD Grps	4.1.5

Tells the AD Groups Provisioning Wizard which AD group objects to consider when merging AD objects with Notes objects (by matching AD attribute values with Notes attribute values in corresponding objects). The parameter defines a subexpression of a customized AD search query. This feature is useful in cases where two or more objects may carry the same value for the AD attribute designated in the app run, but the objects can be differentiated by some other attribute. The <test> value must be formatted as an AD query subexpression, including opening and closing parentheses, as in:

        GroupsSearchFilter=(objectClass=group)

The above example tells the program to consider only an object whose *objectClass* parameter value is "group." Conversely, the set may be defined by exclusion, as in *GroupsSearchFilter=(!(objectClass=user))* to tell the wizard to disregard any object whose *objectClass* parameter value is "user," but to consider all others.

[ActiveDirectory] GroupType=<XXX>

Type:	Default:	Occurs in:
keyword	GDL	AD Grps

This value corresponds to two GUI elements in the AD Groups Provisioning Wizard, the **Group Scope** and **Group Type** radio buttons in the *Choose your method for finding objects* screen. The program writes this value to the Task Parameters from an admin's GUI entries; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter determines which GroupType value the AD Groups Wizard will assign to all groups it provisions in Active Directory. The parameter value is a three-letter string defined by the combination of two elements, representing the two GUI elements:

Group Scope — 1st Element (one letter):	Group Type — 2nd Element (two letters):
G = Global L = Local [domain] U = Universal	DL = Distribution List SG = Security Group

For example, the default setting *GroupType=GDL* signifies a Global Distribution List. Similarly, *GroupType=LSG* tells the wizard to set all *GroupType* values to LSG (Local Security Group).

After the wizard runs, you can edit the SQL Server database or a group collection's data table to change the *GroupType* setting for any one or more groups individually, and thereby provision groups of different types within a single run of the Data Migration Wizard. But the wizard will initially set all the *GroupType* values to whatever value is defined by this parameter setting.

[ActiveDirectory] HomeMailboxStore=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	[inferred from operating environment]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Mailbox store** drop-down list box in the *Specify Exchange Mailbox Information* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

This value is used when mailbox-enabling users in Exchange, and the options that appear in the drop-down list box are inferred by the program from the operating environment for the associated AD access credentials. For example:

HomeMailboxStore=First Storage Group/Mailbox Store (MOBE)

... specifies the listed value as the home mailbox store for mailbox-enabling users. The mailbox store specified here can be overridden on a per-user basis by the contents of the *ExchangeMailboxStore* column in the SQL Server database.

[ActiveDirectory] HomeServer=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	[inferred from operating environment]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Server** drop-down list box in the *Specify Exchange Mailbox Information* screen. The program writes this value to the Task Parameters from an

admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The value is used when mailbox-enabling users in Exchange, and the options that appear in the drop-down list box are inferred by the program from the operating environment for the associated AD access credentials. For example: *HomeServer=Goober/First Admin Group/MOBE* specifies the listed value as the home server for mailbox-enabling users.

[ActiveDirectory] Host=<HostName>

Type:	Default:	Occurs in:
string	[none]	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Global Catalog host name text box for Active Directory credentials (not User Forest credentials) in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters based on an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory] LoadMethod=<OneValidOption>

Type:	Default:	Occurs in:	New in:
keyword	[none]	Data Migr	3.2

This value corresponds to a GUI element in the Data Migration Wizard, the **How users were loaded...** drop-down list in the *How were Accounts Loaded into Active Directory* screen. The wizard writes this value to the Task Parameters based on an administrator's GUI entry. If a value is entered for this parameter prior to the wizard being run, the value specified here is the default selection that appears in the drop-down list. This parameter can also be used to add an extra option (*OtherFindAttribute*) to the drop-down list.

For example, if:

    LoadMethod=OtherFindAttribute

... the wizard adds the *OtherFindAttribute* method to the list, and makes it the default selection. By the *OtherFindAttribute* method, the wizard associates AD objects with the Notes counterparts by comparing the values of a particular AD attribute with the values in the *SearchKey* column of the collection data table. The AD attribute must be specified by the *ADAttribute* parameter in this [ActiveDirectory] section. The two parameters are therefore typically specified together, as in this example:

    [ActiveDirectory]
    LoadMethod=OtherFindAttribute
    ADAttribute=userPrincipalName

[ActiveDirectory] MailEnableAttempts=<#>

Type:	Default:	Occurs in:
integer	3	Prov

Determines the maximum number of times the Provisioning Wizard attempts to mail-enable an object in AD before giving up and logging a failure error. The default is 3 but the parameter accepts any value in the range 1 to 1000, inclusive. Note that the *MailEnableRetryWaitSeconds* parameter, also in this [ActiveDirectory] section, determines the number of seconds the wizard waits between these attempts.

[ActiveDirectory] MailEnableRetryWaitSeconds=<#>

Type:	Default:	Occurs in:
integer	30	Prov

Determines the number of seconds the Provisioning Wizard waits between attempts to mail-enable an object in AD. The default is 30, but the parameter accepts any value in the range 1 to 30000 (30000 seconds = 500

minutes) inclusive. Note that the *MailEnableAttempts* parameter, also in this [ActiveDirectory] section, determines the maximum number of mail-enable attempts for an object before the wizard gives up and logs a failure error.

[ActiveDirectory] MBoxFromContact=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Tells the Data Migration Wizard whether to convert a contact to a mailbox when mailbox enabling. This feature is off (0) by default since in a typical scenario no contacts should remain after the Provisioning Wizard has run (merging contacts into existing AD objects). This feature would be irrelevant, but in the event any contacts do remain, most administrators would prefer the wizard generate an error rather than convert the contact to a mailbox, which would likely yield two objects for a single user. The parameter permits the enabling of the feature by:

    MBoxFromContact=1

... for rare circumstances where the option is preferred. If *MBoxFromContact=1*, any *UserFilter* or *ContactFilter* parameters that were previously been defined in the [ActiveDirectory] section should be removed.

[ActiveDirectory] MergeContactAttribWins=<#>

Type:	Default:	Occurs in:
boolean	0	Prov

    MergeContactAttribWins=1

... the wizard overwrites AD user object data with the corresponding contact data when merging if both the contact and the AD user object fields contain single values (neither field is null and neither contains multiple values). If either contains multiple values, the wizard does add contact values to the existing AD user object values. By default (*MergeContactAttribWins=0*), the wizard will not overwrite any AD user object data when both the Contact and the corresponding AD user object fields contain values.

[ActiveDirectory] MergeContactIsAuthoritative=<#>

Type:	Default:	Occurs in:
boolean	0	Prov

Determines whether the Provisioning Wizard will overwrite (1) or not overwrite (0) AD user object data with the corresponding contact data when merging, even if the contact element is null. By default (*MergeContactIs-Authoritative=0*), the wizard will not overwrite the AD user object data unless the AD object value is null.

[ActiveDirectory] MergeCrossCheckObjs=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Prov	3.1.0

Determines whether the program will perform its normal attribute verifications between a contact and its associated user security object. For example:

    MergeCrossCheckObjs=0

... tells the program to not perform its normal attribute verifications between a contact and its associated user security object. Suppressing the normal verifications would be useful, for example, if a target security object is already mail-enabled for a Notes address that is different from the contact Notes address, since the normal attribute verifications would not permit merging the two. By default (1) the program merges a contact and its associated security object only if it can verify certain expected attribute conditions in the contact and object.

[ActiveDirectory] MergeFindbySMTP=<#>

Type:	Default:	Occurs in:
boolean	0	Prov

This value corresponds to a GUI element in the Provisioning Wizard, the **How contacts were loaded…** drop-down list box in the *Choose your method for finding objects* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

MergeFindbySMTP determines which of two methods the wizard will use to find a Contact when merging: by the SMTP address (*MergeFindbySMTP=1*), or the default method (*MergeFindbySMTP=0*) of finding a Contact by its Notes source address. The value of this parameter also sets defaults for two other related parameters in this [ActiveDirectory] section:

	Default for *MergeReqImportedFrom*	Default for *MergeReqProxyAddress*
If MergeFindbySMTP=1	0	0
If MergeFindbySMTP=0	1	1

[ActiveDirectory] MergeGrpMembership=<#>

Type:	Default:	Occurs in:
boolean	1	Prov

When merging, the default setting (*MergeGrpMembership=1*) tells the wizard to add a user to a group if the corresponding Contact is a member of the group. The alternate setting disables this feature:

    MergeGrpMembership=0

[ActiveDirectory] MergeReqImportedFrom=<#>

Type:	Default:	Occurs in:	New in:
boolean	1 or 0	Prov	3.1.0

Determines whether the program will require that a contact be imported from the Microsoft Connector, rather than manually created. For example:

    MergeReqImportedfrom=1

... tells the program to verify that each contact was imported by the Microsoft Connector. If a contact was manually created, the program will skip the contact and note an error in the log. To tell the program to not require this, set the parameter to *MergeReqImportedfrom=0*.

The default value for this parameter is determined by the *MergeFindbySMTP* setting, also in this [ActiveDirectory] section. The *MergeReqImportedfrom* default is the boolean opposite (1 vs. 0) of the *MergeFindbySMTP* setting.

[ActiveDirectory] MergeReqProxyAddress=<#>

Type:	Default:	Occurs in:	New in:
boolean	1 or 0	Prov	3.1.0

Determines whether the program will require that each contact contain two Notes addresses. For example, the default:

    MergeReqProxyAddress=1

... tells the program to require that each contact contain two Notes addresses, and to skip a contact and note an error in the log if the contact does not contain two Notes addresses. (Microsoft's Connector ordinarily associates two Notes addresses with each contact.) Conversely, *MergeReqProxyAddress=0* tells the program to not require

two addresses per contact. The default value for this parameter is determined by the *MergeFindbySMTP* setting, also in this [ActiveDirectory] section. The *MergeReqProxyAddress* default is the boolean opposite (1 vs. 0) of the *MergeFindbySMTP* setting.

[ActiveDirectory] MergeSyncObjRequired=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	3.1.0

Determines whether the program will require a contact to merge with a corresponding security object. For example:

MergeSyncObjRequired=1

... tells the program to require a contact, so the program will merge the contact by its source address with a corresponding security object, by the *SearchKey* column. By default (0), a contact is not required, and the program will mail-enable a security object based only on the *SearchKey* column.

[ActiveDirectory] MergeX500=<##>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.3

Tells the wizard whether to copy X500 addresses into their corresponding AD user objects. For example:

MergeX500=1

… tells the wizard to merge X500 addresses into the AD user objects. By default (*MergeX500=0*) the wizard will not merge X500 addresses.

[ActiveDirectory] OpenFlags=<##>

Type:	Default:	Occurs in:	Updated in
keyword (numeric)	65	AD Grps, Prov, Data Migr	4.16.1

A numeric representation of the method by which the wizard opens Active Directory. (If this system is configured for a User Forest and a Resource Forest, this parameter applies to the Resource Forest, and another *OpenFlags* parameter in the [ActiveDirectory2] section applies to the User Forest.) For more information and a list of valid options, see this Microsoft article.

The default 65 represents the combination of *ADS_SECURE_AUTHENTICATION* and *ADS_USE_SIGNING*.

[ActiveDirectory] Password=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Password text box for Active Directory credentials (not User Forest credentials) in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters based on an admin's GUI entry. The parameter value here is obfuscated, as a security precaution, and Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory] ProvisionUsers=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.1

This parameter applies when migrating to an On-Premise Exchange or Microsoft 365 with **Use Azure Active Directory Synchronization**.

> ProvisionUsers=1

... tells the Provisioning Wizard to create a new user object in AD when none is found by the wizard to correspond with a user in the collection. Such new user objects are created in the container specified by the [Active Directory] UserContainer parameter and are not mail-enabled unless [Active Directory] EnableUsers=1. By default (0), the wizard will not create such objects.

Compare this [Active Directory]ProvisionUsers parameter to the [Active Directory] CanAddGroupMembers parameter, which defines a new contact (not a user object) for any group member who cannot be found in AD.

[ActiveDirectory] PSRetryAttempts=<#>

Type:	Default:	Occurs in:	New in:
integer	3	Prov	4.6

Determines the maximum number of times that Migrator for Notes to Exchange's Provisioning Wizard will retry data transmissions to Active Directory due to errors in prior attempts. This setting also applies to the retry attempts for failed PowerShell connections.

In some environments, transmissions to AD can occasionally be interrupted, which may lead to incomplete provisioning. This *PSRetryAttempts* parameter is used in conjunction with *PSRetryWait* (see below) to control retries of transmissions to AD. For example, the default settings:

> PSRetryAttempts=3
> PSRetryWait=15

... tell the wizard to retry an AD transmission to a maximum of three attempts (in addition to the initial attempt), at 15-second intervals (note that the default PSRetryWait setting is 40 seconds for Microsoft 365)

If the error persists through all retry attempts, the wizard will note the error in the log, skip the current message property or element, and move on to process the next item. Depending on the **Log level** setting, the retry attempts may appear in the program logs with no other documented error or warning.

[ActiveDirectory] PSRetryWait=<##>

Type:	Default:	Occurs in:	New in:
integer	• 15 • 40 for Microsoft 365	Prov	4.6

Sets the interval (in seconds) between retry attempts when Migrator for Notes to Exchange's Provisioning Wizard will retry data transmissions to Active Directory due to errors in prior attempts. This setting also applies to the retry wait time for failed PowerShell connections.

This *PSRetryWait* parameter is used in conjunction with *PSRetryAttempts* to control retries of transmissions to AD, as described above for the *PSRetryAttempts* parameter. The default is 15 seconds for migration to a proprietary Exchange or 40 seconds for migration to Microsoft 365.

[ActiveDirectory] RemoveSrcAddresses=<#>

Type:	Default:	Occurs in:
boolean	0	NMM, Data Migr

> RemoveSrcAddresses=1

... tells the Data Migration Wizard to remove all Notes source addresses (*notes:proxyAddresses*) so that mailbox-enabled accounts in Active Directory can be synchronized back to Notes as external users. If *RemoveSrcAddresses=0* (default), only the *notes:uid-* address is removed. An object's *notes:uid-* address must be removed once the object has been mailbox-enabled. Other Notes addresses are used to route mail via the Microsoft Connector, if the Connector is used, but otherwise are harmless to leave in place.

[ActiveDirectory] SearchBase=<string>

Type:	Default:	Occurs in:	New in:
string	[search entire forest]	Prov	4.5.4

Limits the search scope of Migrator for Notes to Exchange's Provisioning Wizard to a single domain when searching a multi-domain forest for objects. This feature prevents collisions that could otherwise occur. For example, the search finds John Smith (*JSmith*) in one domain and Jim Smith (*JSmith*) in a different domain. For example:

> SearchBase=dc=sample,dc=com

The default, if left unspecified, is to search the entire forest, as in prior Migrator for Notes to Exchange releases.

[ActiveDirectory] SetOwnerACLsForGroups

Type:	Default:	Occurs in:	New in:
boolean	1	AD Grps	4.16.1

Determines whether the Groups Provisioning Wizard also sets the group owner ACLs for the provisioned groups. (The group owner ACLs correspond to the Name property in the Managed By tab of the AD Group Properties.) The feature is enabled by default (SetOwnerACLsForGroups=1), but you can set the value to 0 to tell the Groups Provisioning Wizard not to set the group owner ACLs.

This parameter is used only when the target is on-premises Exchange. Since at least one owner is required for a distribution group when using the Set-DistributionGroup cmdlets, MNE does not support Exchange Online for these cmdlets. If you do not specify the owner when you create a group, the user account used to create the group (such as Microsoft 365 Admin or Pool Accounts) is automatically set as the owner which would not be expected.

[ActiveDirectory] SetRecipPolicy=<#>

Type:	Default:	Occurs in:
boolean	1	Prov, Data Migr

Determines how Migrator for Notes to Exchange's Provisioning Wizard or Data Migration Wizard, after mail-enabling objects or creating mailboxes, will set the Exchange option **Automatically update e-mail addresses based on e-mail address policy**. (The **Automatically update...** feature is an Exchange feature, offered as a check box in the Exchange Management Console, on the *E-Mail Addresses* tab of the *Data Properties* for each mailbox.) This *SetRecipPolicy* parameter specifies whether the wizard should automatically enable or disable that Exchange feature for the AD objects in the designated user collection.

For example, *SetRecipPolicy=1* tells the wizards to enable the Exchange auto-update feature (mark the Exchange check box) for the AD objects after processing. If *SetRecipPolicy=0*, the wizard disables the Exchange auto-updating feature (unmarks the Exchange check box). The default is 1 for any Exchange target type, including Microsoft 365.

Note: When mailbox-enabling (in the Data Migration Wizard), make sure that the setting for this *SetRecipPolicy* parameter matches the setting for [Exchange] *EmailAddressPolicyEnabled*.

[ActiveDirectory] SetRecipPolicyForGroups=<#>

Type:	Default:		Occurs in:
boolean	1		AD Grps, Data Migr

Determines how Migrator for Notes to Exchange's AD Groups Provisioning Wizard or Data Migration Wizard, after provisioning group objects, will configure the groups to **Automatically update e-mail addresses based on e-mail address policy**. (The **Automatically update...** feature is an Exchange feature, offered as a check box in the Exchange Management Console, on the *E-Mail Addresses* tab of the *Data Properties* for each mailbox.) This *SetRecipPolicyForGroups* parameter tells the wizard whether to automatically enable or disable that Exchange feature for AD group objects in the current collection.

The default is 1 for any Exchange target type, including Microsoft 365.

Note: When provisioning groups, make sure that the setting for this *SetRecipPolicyForGroups=<#>* parameter matches the setting for *[Exchange] EmailAddressPolicyEnabled=<#>*.

[ActiveDirectory] SetUserAccountControl=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.1.5

Determines whether the wizard will set the *userAccountControl* attribute value in Active Directory, to the value specified by the *UserAccountControl* parameter (also in this [ActiveDirectory] section). For example:

    SetUserAccountControl=1

... tells the wizard to read the *UserAccountControl* parameter value to set the AD *userAccountControl* attribute value. (The *UserAccountControl* parameter value defaults to 512 if unspecified.) This feature is off (*SetUserAccountControl=0*) by default.

[ActiveDirectory] ShowSkipPermissionsCheckDialog=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov (Provisioning Wizard)	4.16.2

By default, MNE only logs a warning message when the following parameter is set as follows: [ActiveDirectory] SkipPermissionsCheck=1.

If you set this parameter [ActiveDirectory] ShowSkipPermissionsCheckDialog to 1, MNE will also display a warning dialog to let you know that the Active Directory permissions check was skipped.

[ActiveDirectory] SkipDisabledGroupMembers=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	AD Grps	4.15.2

By default, the AD Groups Provisioning wizard may include

- deactivated users
- users that do not have permission to sign in and access the services and data in the Microsoft 365 organization

To skip these users, set SkipDisabledGroupMembers=1.

[ActiveDirectory] SkipPermissionsCheck=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov (Provisioning Wizard)	4.16.1

During Active Directory configuration, MNE checks the migration account for full global administrative access permissions by default instead of checking for access rights to the specified containers and organization units (OUs).

To skip the permissions check when you are configuring MNE for Active Directory, specify [ActiveDirectory] SkipPermissionsCheck=1.

[ActiveDirectory] SQLColumn=<value>

Type:	Default:	Occurs in:
keyword	0	Prov

This value corresponds to a GUI element in the Provisioning Wizard, the **Choose a database column...** list box in the *Choose your method for finding objects* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory] UserAccountControl=<###>

Type:	Default:	Occurs in:	New in:
integer	512	Prov	4.1.5

Tells the wizard to set the *userAccountControl* attribute value in Active Directory to the parameter value specified here. The wizard will read this parameter specification only if *SetUserAccountControl=1* (also in this [ActiveDirectory] section). If the parameter is unspecified, its value defaults to 512. For example:

        UserAccountControl=1024

... tells the wizard to set the AD *userAccountControl* attribute value to 1024.

[ActiveDirectory] UserCannotChangePassword=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.15.1

This value corresponds to a GUI element in the Provisioning Wizard, the **User cannot change password** check box in the *Specify Container for User Objects* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

This parameter applies when migrating to an On-Premise Exchange or Microsoft 365 with **Use Azure Active Directory Synchronization**.

        UserCannotChangePassword=1

...tells the Provisioning Wizard that users newly created by the wizard (if `[ActiveDirectory] ProvisionUsers=1`) cannot change their password. By default (0), any newly created users can change their password.

This parameter and the parameter `[ActiveDirectory] UserChangePasswordAtNextLogon` are mutually exclusive. Enabling (1) this parameter automatically rules out the other (and its corresponding GUI check box).

[ActiveDirectory] UserChangePasswordAtNextLogon=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Prov	4.15.1

This value corresponds to a GUI element in the Provisioning Wizard, the **User must change password at next logon** check box in the *Specify Container for User Objects* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

This parameter applies when migrating to an On-Premise Exchange or Microsoft 365 with **Use Azure Active Directory Synchronization**.

> UserChangePasswordAtNextLogon=1

...tells the Provisioning Wizard that users newly created by the wizard (if `[ActiveDirectory] ProvisionUsers=1`) must change their password at next logon. By default (1), any newly created users must change their password at next logon.

This parameter and the following parameters are mutually exclusive. Enabling (1) this parameter automatically rules out the others (and their corresponding GUI check boxes):

* `[Active Directory] UserCannotChangePassword`

* `[Active Directory] UserPasswordNeverExpires`

[ActiveDirectory] UserContainer=<RDN>

Type:	Default:	Occurs in:	New in:
string	[none]	AD Grps, Prov	4.1

This parameter applies only when migrating to a proprietary Exchange.

Specifies the relative domain name (RDN) of the container where the Provisioning Wizard will create a new object when the wizard finds none to correspond with a user in the collection, and if *ProvisionUsers=1* (as defined earlier in this [ActiveDirectory] section). For example:

> UserContainer=cn=Users

... will put all new users in the Users container. The designated container must already exist. This *UserContainer* parameter is required if *ProvisionUsers=1*.

[ActiveDirectory] UserFilter=<test>

Type:	Default:	Occurs in:	New in:
string	[none]	Prov, Data Migr	3.2

Defines a subexpression of a customized AD search query, to tell the program which AD user objects to consider when merging AD objects with Notes objects (by matching AD attribute values with Notes attribute values in corresponding objects). This feature is useful in cases where two or more objects may carry the same value for the AD attribute designated in the app run, but the objects can be differentiated by some other attribute. The <test> value must be formatted as an AD query subexpression, including opening and closing parentheses, as in:

> UserFilter=(objectClass=user)

The above example tells the program to consider only an object whose *objectClass* parameter value is "user." Conversely, the set to be considered may be defined by exclusion, as in *UserFilter=(!(objectClass=contact))* to tell the wizard to disregard any object whose *objectClass* parameter value is "contact," but to consider all others.

[ActiveDirectory] UseInternetAddressForUPN=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.15.1

Determines whether the wizard will set the `UserPrincipleName` attribute value to be internet address in Active Directory. For example:

```
UseInternetAddressForUPN=1
```

... tells the Provisioning Wizard to set the UPN value to be an internet address when creating the AD User. Also, when set to 1, this parameter takes precedence over the parameter `[ActiveDirectory]` `UseO365DomainForUPN`.

By default (0), the wizard does not set the UPN to an internet address.

[ActiveDirectory] UseO365DomainForUPN=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Prov	4.7

This parameter and the parameter `[Exchange] DirSyncEnableRemoteMailbox` together support hybrid Microsoft 365 migration (O365 provisioned by a local proprietary AD) with a local Exchange server and remote mailboxes (on O365) for some or most users.

```
UseO365DomainForUPN=1
```

... tells the Provisioning Wizard to use an Microsoft 365 domain for the AD objects' UPNs regardless of local AD naming preference.

[ActiveDirectory] Userid=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the **User name** text box for Active Directory credentials (not User Forest credentials) in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually change this value except at the direction of Quest Support.

[ActiveDirectory] UserPasswordNeverExpires=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.15.1

This value corresponds to a GUI element in the Provisioning Wizard, the **Password never expires** check box in the *Specify Container for User Objects* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

This parameter applies when migrating to an On-Premise Exchange or Microsoft 365 with **Use Azure Active Directory Synchronization**.

```
UserPasswordNeverExpires=1
```

...tells the Provisioning Wizard that for users newly created by the wizard (if `[ActiveDirectory]` `ProvisionUsers=1`), their password never expires. By default (0), any newly created users have a password expiry time.

This parameter and the parameter `[ActiveDirectory] UserChangePasswordAtNextLogon` are mutually exclusive. Enabling (1) this parameter automatically rules out the other (and its corresponding GUI check box).

[ActiveDirectory2] section

[ActiveDirectory2] AdAttribute=<AttributeName>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.0

Specifies the AD attribute whose values the Data Migration Wizard should seek to match with values in the SearchKey2 column of the SQL Server database, to match corresponding user accounts in the resource and user forests. For example:

    [ActiveDirectory2]
    AdAttribute=userPrincipalName

... tells the wizard to match AD objects with users such that the value of each AD object's userPrincipalName attribute matches the value of the corresponding user's SearchKey2 column in the SQL Server database.

[ActiveDirectory2] Host=<HostName>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Host name text box for User Forest credentials (not Active Directory credentials) in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters based on an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory2] OpenFlags=<##>

Type:	Default:	Occurs in:	Updated in
keyword	65	Data Migr	4.16.1

A numeric representation of the method by which the wizard opens Active Directory. (If this system is configured for a User Forest and a Resource Forest, this parameter applies to the User Forest, and another *OpenFlags* parameter in the [ActiveDirectory] section applies to the Resource Forest.) For more information and a list of valid options, see this Microsoft article.

The default 65 represents the combination of *ADS_SECURE_AUTHENTICATION* and *ADS_USE_SIGNING*.

[ActiveDirectory2] Password=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Password text box for User Forest credentials (not Active Directory credentials) in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters based on an admin's GUI entry. The parameter value here is obfuscated, as a security precaution, and Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory2] UserFilter=<test>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2

Tells the program which AD user objects to consider when matching corresponding user accounts in a resource forest and user forest (as described above for the *AdAttribute* parameter in this same [ActiveDirectory2] section).

The *<test>* parameter value is a logical test that defines the set of objects for the program to consider. For example:

> UserFilter=(objectClass=user)

... tells the program to consider only an object whose *objectClass* parameter value is "user." Conversely, the set to be considered may be defined by exclusion, as in:

> UserFilter=(!(objectClass=contact))

... to tell the wizard to disregard any object whose *objectClass* parameter value is "contact," but to consider all others.

[ActiveDirectory2] UserID=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the **User name** text box for User Forest credentials (not Active Directory credentials) in the *Active Directory Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectory2] UseUserForest=<#>

Type:	Default:	Occurs in:
boolean	0	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in Notes Migration Manager: the **Use resource/user Forest** check box in the *Active Directory Configuration* screen. The administrator's entry value is written to the Task Parameters; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ActiveDirectoryMatchList] section

[ActiveDirectoryMatchList] ADML<#>=<AttribName>

Type:	Defaults:	Occurs in:	New in:
keyword ("ADML"+ one or two digits)	[as noted below]	Prov	4.0.0

Each *ADML<#>* parameter names an AD attribute that the Provisioning Wizard will include in its drop-down list box of options, from which one attribute must be chosen to facilitate the matching of Contacts with AD objects.

The Provisioning Wizard associates Contacts with AD objects by comparing the unique values of a particular AD object attribute to the unique values of a corresponding column in the SQL Server database. Where these values match, the associated Contact and AD Object are assumed to represent the same entity, and the two are therefore merged. During the wizard's run, the *Choose Your Method...* screen requires that you specify the AD attribute and the database column to use for these comparisons. The designations on that screen are accomplished by drop-down list boxes that list available options for the database column and AD attribute, respectively. The *ADML<#>* parameters define the contents of the drop-down list box for AD attributes.

The default list of available choices for the AD attribute contains 26 options, by these 26 default parameter values:

```
ADML0=cn                          ADML13=extensionAttribute3
ADML1=mail                        ADML14=extensionAttribute4
ADML2=mailNickname                ADML15=extensionAttribute5
ADML3=proxyAddresses              ADML16=extensionAttribute6
ADML4=sAMAccountName              ADML17=extensionAttribute7
ADML5=userPrincipalName           ADML18=extensionAttribute8
ADML6=targetAddress               ADML19=extensionAttribute9
ADML7=employeeNumber              ADML20=extensionAttribute10
ADML8=distinguishedName           ADML21=extensionAttribute11
ADML9=altRecipient                ADML22=extensionAttribute12
ADML10=legacyExchangeDN           ADML23=extensionAttribute13
ADML11=extensionAttribute1        ADML24=extensionAttribute14
ADML12=extensionAttribute2        ADML25=extensionAttribute15
```

The digit(s) appended to an *ADML<#>* key name differentiate one parameter from another. The multiple *ADML<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. But the wizard will read only *ADML<#>* parameters whose differentiating digits are less than a value specified by a *Count* parameter in the first line of the same section. See the *Count* parameter below for more information.

```
[ActiveDirectoryMatchList]
Count=26
ADML0=cn
ADML1=mail
ADML2=mailNickname
ADML3=....
```

[ActiveDirectoryMatchList] Count=<##>

Type:	Default:	Occurs in:	New in:
integer	26	Prov	4.0.0

A limit to the number of *ADML<#>* parameters (see above) that the Provisioning Wizard will process in this section. The wizard will read only *ADML<#>* parameters whose differentiating digits are less than the *Count* parameter value. For example, if:

```
[ActiveDirectoryMatchList]
Count=5                           ADML3=proxyAddresses
ADML0=cn                          ADML4=sAMAccountName
ADML1=mail                        ADML5=userPrincipalName
ADML2=mailNickname                ADML6=targetAddress
```

... the wizard will read all the parameters except *ADML5* and *ADML6*, since *Count=5*, and neither 5 nor 6 is less than 5.

If unspecified, the *Count* parameter defaults to 26. If specified, the parameter must occur as the first line of the section, as shown above.

[ArchiveCalFolderFilter] section

[ArchiveCalFolderFilter] Count=<##>

Type:	Default:	Occurs in:
integer	10	Data Migr

A limit to the number of *Filter<#>* parameters (see below) that the Data Migration Wizard will process in this section. The wizard will read only *Filter<#>* parameters whose differentiating digits are less than the *Count* parameter value. For example, if:

```
[ArchiveCalFolderFilter]
Count=15                    Filter7=~ROOT
Filter0=~INBOX              Filter8=~TASKS
Filter1=~CALENDAR          Filter12=~TRASH
Filter2=~SENT              Filter19=~DRAFTS
```

... the wizard will read all the parameters except *Filter19*, since *Count=15* and 19 > 15.

If unspecified, the *Count* parameter defaults to 10. If specified, the parameter must occur as the first line of the section, as shown above.

[ArchiveCalFolderFilter] Filter<#>=<~FolderName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Identifies a Notes source folder from which archived calendar mail will be excluded from the migration. The Data Migration Wizard discriminates between emails associated with calendar items (invitations, acceptance notifications, etc.), and other (non-calendar) emails, and can optionally exclude from the migration either type that originate from one or more designated source folders. Filter parameters in this [ArchiveCalFolderFilter] section identify the source folders from which archived calendar emails will be excluded. Other parameter sections may contain parameters to exclude other item types from certain source folders:

- [ServerCalFolderFilter] to exclude server-based calendar-associated emails.

- [ServerMailFolderFilter] to exclude server-based non-calendar emails.

- [ArchiveMailFolderFilter] to exclude archived non-calendar emails.

Within each such section, each parameter identifies a single source folder to which the filter will be applied. For example:

```
[ArchiveCalFolderFilter]
Filter0=~INBOX
```

... tells the wizard to apply the filter to the Inbox, while the section name in this example tells the wizard that the filter should exclude archived calendar emails. For each such parameter, the parameter value specifies the mailbox by prepending a tilde character to the mailbox name, as follows:

~INBOX: Inbox	~ROOT: [Root Dir]
~CALENDAR: Calendar	~TASKS: Tasks
~SENT: Sent Items	~TRASH: Trash
~DRAFTS: Drafts	

You may define one or more *Filter<#>* parameters within the section. The digit(s) appended to a *Filter<#>* key name differentiate one parameter from another. Multiple *Filter<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. For example, a section may contain only:

```
Filter0=~INBOX
Filter4=~SENT
Filter8=~TASKS
Filter5=~TRASH
```

But the wizard will read only *Filter<#>* parameters whose differentiating digits are less than a value specified by a *Count* parameter in the first line of the section. See the *Count* parameter above for more information.

[ArchiveData] section

[ArchiveData] MigrateCalData=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Migrate calendar data check box in the Migrate archives section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ArchiveData] MigrateEncryptedMessages=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.2

Determines whether the wizard should attempt to migrate the encrypted portions of encrypted messages in the source user archives. Typical usage is described below. This feature can also be applied to encrypted messages in the source server, by this same parameter name in the [ServerData] section of these parameters. The feature is also available for the SSDM (same parameters in the same sections, but in *notesdtapp.ini*), but in SSDM the default is 1.

The Data Migration Wizard can migrate the encrypted portion of an encrypted message only if it has the access credentials of the user who is authorized to decrypt the encrypted portion. An encrypted message also contains unencrypted portions, which the wizard can migrate in any case, even if it lacks the credentials to migrate the encrypted portion. In that case, the wizard can migrate the unencrypted portions, skip the encrypted portions, and insert text notices that the encrypted portions could not be migrated.

In most organizations, only the sender or recipient of an encrypted message is authorized to access the encrypted portion, and the wizard will not know those credentials unless the admin account running the wizard happens to be the sender or recipient of the encrypted message. It is possible, but uncommon, for an environment to be configured with broader or even universal access to the encrypted portions of encrypted messages, and in that case the wizard can freely migrate encrypted messages in their entirety. But in the more likely case where the access credentials are much more restrictive, the wizard will be unable to migrate the encrypted portions of encrypted messages.

If access credentials for encrypted messages are more restrictive, the default:

    MigrateEncryptedMessages=0

… tells the wizard to not even attempt migrating the encrypted portions, but to just migrate the unencrypted portions with the substitute notice. This option may improve performance simply by eliminating a wizard function that is rarely if ever needed in that scenario. Many organizations with restrictive access credentials simply use Migrator for Notes to Exchange's SSDM to migrate encrypted messages, since the SSDM will always have the access credentials of the user who is running it.

If *MigrateEncryptedMessages=1*, the wizard will attempt to migrate the encrypted portions, and will succeed or fail depending on whether the admin account running the wizard has the necessary credentials. If it fails, the wizard will migrate the message, skip the unencrypted portions and insert the substituted notice—the same outcome as for *MigrateEncryptedMessages=0*.

This feature can also be applied to encrypted messages in the source server, by this same parameter name in the [ServerData] section of these parameters. The feature is also available for the SSDM (same parameters in the same sections, but in *notesdtapp.ini*).

A related Migrator for Notes to Exchange parameter lets you tell the wizard to skip an entire message (both encrypted and unencrypted portions) if the wizard is already configured to skip the encrypted portion (only) by *MigrateEncryptedMessages=0*. See *SkipEntireEncryptedMessage* in this same [ArchiveData] section for more information.

[ArchiveData] MigrateTaskData=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.2.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate task data** check box in the *Migrate archives* section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ArchiveData] MigrateTrashFolder=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate trash folder** check box in the **Migrate archives** section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ArchiveData] MigrateViews=<#>

Type:	Default:	Occurs in:
keyword (single digit 0,1 or 2)	0 (but the wizard initializes the value to 1)	Data Migr

Determines whether and how the Data Migration Wizard will migrate archive items that occur within Notes views. For example, *MigrateViews=1* tells the wizard to migrate items only from the first view in which they are found. Valid parameter values are:

> 0 (default): No views are migrated.
> 1: Items are migrated only from the first view in which they are found.
> 2: Items are migrated from all views in which they are found.

Note that the wizard will initialize this parameter to 1 if it is omitted from the task INI file, even though technically the program default is 1. You must explicitly include the parameter in Global Defaults or Task Parameters if you want the wizard to run with *MigrateViews=0* or *MigrateViews=2*.

[ArchiveData] RecordOriginalFolderNameAsKeyword=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.1

Determines whether the Data Migration Wizard, when migrating archives to a different target folder, will add a keyword to the archive message that identifies the message's original folder name. For example, a different target folder would include subfolders under a pseudo root (with [ArchiveData] UsePseudoRoot=1) as compared to the primary Outlook mailbox (the main root).

> RecordOriginalFolderNameAsKeyword=0

... tells the wizard not to add the keyword in the format of "Folder: ArchiveTitle\\OriginalFolderName" to the archive message when migrating it to a different target folder. By default (1), the wizard adds the keyword to the migrated archive message.

[ArchiveData] SkipEntireEncryptedMessage=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.6

Determines whether the Data Migration Wizard will skip entire encrypted messages (skip both encrypted and unencrypted portions) in the source user archives if the wizard is already configured to skip the encrypted portions by *MigrateEncryptedMessages=0* (also in this [ArchiveData] section).

> SkipEntireEncryptedMessage=1

… tells the wizard to skip any encrypted messages in their entirety if *MigrateEncryptedMessages=0*. This *SkipEntireEncryptedMessage* parameter is irrelevant and ignored if *MigrateEncryptedMessages=1*.

For more information about how encrypted messages are migrated, and how this *SkipEntireEncryptedMessage* parameter helps control how the wizard processes encrypted messages, see the parameter notes for the *MigrateEncryptedMessages* parameter earlier in this [ArchiveData] section.

[ArchiveData] UsePseudoRoot=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.5.4

Determines whether the Data Migration Wizard will migrate archives to the primary Outlook mailbox (the main root) rather than to subfolders under a pseudo root. For example:

> UsePseudoRoot=0

... tells the wizard to migrate archives to the top-level mailbox (without a pseudo-root folder). By default (1), the wizard migrates archives to subfolders under a pseudo root.

[ArchiveData] UseSpecialArchiveFolder=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16

Determines whether the Data Migration Wizard will migrate archives to the special Archive folder or to a pseudo root folder under the special Archive folder of the primary mailbox or archive mailbox (in-place archive). For example:

> UseSpecialArchiveFolder=0

... tells the wizard to migrate archives to the target's top-level mailbox folder with or without a pseudo-root folder (determined by UsePseudoRoot parameter). By default (1), the wizard migrates archives to the special Archive folder if such folder exists in the target mailbox.

[ArchiveMailFolderFilter] section

[ArchiveMailFolderFilter] Count=<##>

Type:	Default:	Occurs in:
integer	10	Data Migr

A limit to the number of *Filter<#>* parameters (see below) that the Data Migration Wizard will process in this section. The wizard will read only *Filter<#>* parameters whose differentiating digits are less than the *Count* parameter value. For example, if:

        [ArchiveMailFolderFilter]
        Count=15   Filter7=~ROOT
        Filter0=~INBOX   Filter8=~TASKS
        Filter1=~CALENDAR   Filter12=~TRASH
        Filter2=~SENT   Filter19=~DRAFTS

... the wizard will read all the parameters except Filter19, since *Count=15* and 19 > 15. If unspecified, the *Count* parameter defaults to 10. If specified, the parameter must occur as the first line of the section, as shown above.

[ArchiveMailFolderFilter] Filter<#>=<~FolderName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Identifies a Notes source folder from which archived non-calendar mail will be excluded from the migration. The Data Migration Wizard can discriminate between emails associated with calendar items (invitations, acceptance notifications, etc.), and other (non-calendar) emails, and can optionally exclude from the migration either type that originate from one or more designated source folders. Filter parameters in this [ArchiveMailFolderFilter] section identify the source folders from which archived non-calendar emails will be excluded. Other sections in this same Default Settings list may contain parameters to exclude other item types from certain source folders:

- [ServerCalFolderFilter] to exclude server-based calendar-associated emails.

- [ServerMailFolderFilter] to exclude server-based non-calendar emails.

- [ArchiveCalFolderFilter] to exclude archived calendar-associated emails.

Within each such section, each parameter identifies a single source folder to which the filter will be applied. For example:

        [ArchiveMailFolderFilter]
        Filter0=~INBOX

... tells the wizard to apply the filter to the Inbox, while the section name in this example tells the wizard that the filter to be applied should exclude archived mail items (non-calendar-associated emails). For each such parameter, the parameter value specifies the mailbox by prepending a tilde character to the mailbox name, as follows:

        ~INBOX: Inbox
        ~CALENDAR: Calendar   ~ROOT: [Root Dir]
        ~SENT: Sent Items   ~TASKS: Tasks
        ~DRAFTS: Drafts   ~TRASH: Trash

You may define one or more *Filter<#>* parameters within the section. The digit(s) appended to a *Filter<#>* key name differentiate one parameter from another. Multiple *Filter<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. For example, a section may contain only:

        Filter0=~INBOX
        Filter4=~SENT

Filter8=~TASKS
    Filter5=~TRASH

But the wizard will read only *Filter<#>* parameters whose differentiating digits are less than a value specified by a *Count* parameter (see above) in the first line of the section.

[AzureADAuthorizationEndPointUris] section

This section contains a list of PowerShell URLs for each of the Microsoft 365 clouds that are supported by MNE. These values are used by the Migration Console Exchange Server page to set the `[Exchange]` `AzureADAuthorizationEndPointUri` setting.

The values in this section should only be modified at the direction of Quest support.

[Categories] section

These [Categories] parameters are all auto-set parameters (see GUI-set and other "auto-set" parameters) that define the Outlook categories that correspond to various English equivalents. The Setup program automatically sets these parameters to their English defaults. If a default is not correct for your locale, be sure to change it before you run the Data Migration Wizard.

[Categories] C=<LocalizedCategoryName>

Type:	Default:	Occurs in:
string	Clients	Data Migr

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *C=Clients*

[Categories] H=<LocalizedCategoryName>

Type:	Default:	Occurs in:
string	Holiday	Data Migr

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *H=Holiday*

[Categories] P=<LocalizedCategoryName>

Type:	Default:	Occurs in:
string	Projects	Data Migr

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *P=Projects*

[Categories] PC=<LocalizedCategoryName>

Type:	Default:	Occurs in:
string	Phone Calls	Data Migr

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *PC=Phone Calls*

[Categories] T=<LocalizedCategoryName>

Type:	Default:	Occurs in:
string	Travel	Data Migr

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *T=Travel*

[Categories] V=<LocalizedCategoryName>

Type:	Default:	Occurs in:
string	Vacation	Data Migr

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *V=Vacation*

[Coexistence] section

[Coexistence] CalendarViaConnector=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Calendar Co-Existence is using radio buttons in the *Specify Mail Routing Options* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Coexistence] MailViaConnector=<#>

Type:	Default:	Occurs in:	New in:	Option 3 added in:
keyword	[GUI entry]	Data Migr	4.1	4.3.2

This value corresponds to a GUI element in the Data Migration Wizard, the Mail Co-Existence is using radio buttons in the *Specify Mail Routing Options* screen. The parameter value is a single digit, 0, 1, 2 or 3, that determines how mail routing will be accomplished during coexistence:

    0: mail coexistence uses SMTP
    1: mail coexistence uses Notes Connector
    2: mail coexistence uses Microsoft Transporter (not supported)
    3: mail coexistence uses Quest Coexistence Manager for Notes

Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Coexistence] UsingActiveMail=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.3.2

This value corresponds to a GUI element in the Data Migration Wizard, the **Using ActiveMail processing** check box in the *Specify Mail Routing Options* screen. A marked check box (*UsingActiveMail=1*) tells the wizard to in turn set another parameter (*NotesFormatPreference*, documented separately in the [Notes] section below) for "*Keep senders' format*," which is the correct setting to enable Active Mail processing via CMN. An unmarked check box (*UsingActiveMail=0*) tells the wizard to set *NotesFormatPreference* for its "*Prefers MIME*" option, which is the correct setting when not using ActiveMail processing.

The **Using ActiveMail processing** check box is available only when the **Quest Coexistence Manager for Notes** radio button has been selected to specify that mail coexistence method. If some other coexistence method is selected, the **Using ActiveMail processing** check box appears grayed-out (unavailable).

The wizard writes this value to the Task Parameters depending on whether the associated check box is marked (1) or unmarked (0). Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[DirectoryExport] section

[DirectoryExport] AllowDuplicateMailinNotesAddress=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Dir Exp	4.16.3

Quest recommends that you do not manually enter or change this value except at the direction of Quest Support. When set to 1, this parameter allows MNE to export Notes mail-in databases that have duplicate Notes addresses from a Notes directory. This parameter should be used only in special migration projects with the assistance from Quest PSO.

[DirectoryExport] AllowFullMailboxAddresses=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Dir Exp	4.11

Determines whether the Directory Export Wizard will (1) or will not (0) support other forms of SMTP addresses for distribution group members in addition to the "bare" SMTP addresses (e.g., *user@sitraka.com*). For example:

    [DirectoryExport]
    AllowFullMailboxAddresses=1

... tells the wizard to also accept SMTP addresses for distribution group members in either of these forms:

    Display Name <user@sitraka.com>
    \"Display Name\" <user@sitraka.com>

[DirectoryExport] CreateTsvForAutoResolvedAddresses=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Dir Exp	4.16.1

Determines whether the Directory Export Wizard will create a TSV file to capture the data for Notes objects that had addresses which were auto-resolved by the wizard. An Address Issues Report button appears on Task Completed screen if the TSV file is created. The administrator can click the button to open the TSV file to confirm

the addresses. This parameter controls only whether the wizard generates a TSV file for the auto-resolved addresses.

[DirectoryExport] DefaultDominoDomain=<DefaultNotesDomainName>

Type:	Default:	Occurs in:	New in:
string	Empty	Dir Exp	4.16.3

Quest recommends that you do not manually enter or change this value except at the direction of Quest Support. This parameter is used to specify the default Domino Notes Domain name for address resolution when the Notes property FromDomain is empty and Notes domain name was not found in a mail message during migration. This parameter is needed only when duplicate Notes addresses are allowed in the MNE database in special migration projects.

[DirectoryExport] CreateTsvForSkippedDuplicates=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Dir Exp	4.7

Determines whether the Directory Export Wizard will create a TSV file to capture data for Notes objects that the wizard skipped due to conflicting (duplicate) primary SMTP addresses. The administrator can use the TSV file to script and/or otherwise make corrections to data in the Migrator for Notes to Exchange database. Migrator for Notes to Exchange always skips such objects. This parameter controls only whether the wizard generates a TSV file for the skipped object data.

[DirectoryExport] GenerateAliases=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Dir Exp	4.1.5

Determines if MNE generates secondary addresses based on the enabled domains on the **Find Domains** page of the MNE console. By default (GenerateAliases=1), MNE generates secondary addresses. When set to (0), MNE does not generate secondary addresses for the user. Regardless of the INI setting, if the user document on the Domino server contains secondary internet addresses, MNE always adds them to the MNE database as secondary addresses.

[DirectoryExport] KeepMailAddressDN=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Dir Exp	4.9

Determines whether the wizard will (1) or will not (0) extract objects with a Notes canonical forwarding address set to forward to another user.

[DirectoryExport] NoSummary=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Dir Exp	4.2.1

Determines which of two methods the Directory Export Wizard uses for NSF queries. This parameter lets you configure the wizard to be more "forgiving" if it encounters a rare *Field is too large* error that can occur when querying certain unreadable NSF files. By default. (*NoSummary=0*), the error would prevent the wizard from retrieving data from the remaining Notes source documents and the export would fail. But if:

NoSummary=1

... the wizard opens all Notes object records one at a time, rather than opening all non-group object records at once to facilitate a continuous stream of data from all open records. Quest recommends you leave this feature off

(*NoSummary=0*) unless you have encountered the *Field is too large* error, since program performance is likely to suffer (perhaps dramatically) if the wizard has to open and close many object records individually.

In either case, the wizard reports such errors in its log file, but if *NoSummary=1* the wizard ignores the error and resumes reading the remaining source data.

[DirectoryExport] ResolveStaleAliases=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Dir Exp	4.16.1

Determines whether the Directory Export Wizard will clear stale secondary addresses in the MNE database. By default (ResolveStaleAliases=0), MNE keeps all the secondary addresses generated in every Directory Export run. When set to (1), MNE replaces the stale secondary addresses with the latest address for each user to accommodate Domino directory updates during the transition.

[DirectoryExport] SkipCatalogSearch=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Dir Exp	4.1.5

Determines whether the wizard will suppress Domino catalog lookups during the export process, but still leave all other data sources online. This is an alternative to a completely offline migration, and may improve performance in some environments. For example:

    SkipCatalogSearch=1

… tells the wizard to enable the feature, to suppress Domino catalog lookups. The default (*SkipCatalogSearch=0*) leaves this option disabled.

[DirectoryExport] SkipGroupMembers=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Dir Exp	4.1.5

Determines whether the Directory Export Wizard will export or skip group member information. For example:

    SkipGroupMembers=1

… tells the wizard to skip (not export) group member information.

[DirectoryExport] WriteToBulkDirectory=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Dir Exp	4.5.1

Determines whether the Directory Export Wizard will write export data directly to the Bulk Import folder rather than to the temp directory, which yields significant performance improvements in many environments. If that newer method is unsuitable to your configuration, this boolean program parameter lets you revert to the prior method. For example:

    WriteToBulkDirectory=0

... tells the wizard to use the older method. Quest recommends this setting if the bulk directory is not located on the migration server or if the admin's migration server is running Windows XP.

[ErrorsToIgnore] section

[ErrorsToIgnore] Error<#>=[####-###-###-########]

Type:	Default:	Occurs in:
string	[none]	AD Grps, Prov, Dir Exp, Data Loc, NABs Disc, Doms Disc, Data Migr, PAB Replic

Each *Error<#>* parameter identifies a single particular runtime error that the wizard or program should ignore when documenting its activities and outcomes in its log file. Each parameter value:

- Must conform to the form shown here, consisting entirely of digits and hyphens enclosed within square brackets: *[####-###-###-########]*.

- Must be the full, exact string of a single defined error code (no wildcard characters or substrings).

For example:

```
[ErrorsToIgnore]
Error0=[1465-32-4-00000000]
Error1=[7442-1-155-80072035]
Error2=[1400-31-108-00000000]
```

The digit(s) appended to an *Error<#>* key name arbitrarily differentiate one parameter from another. Multiple *Error<#>* parameters need not appear in numerical order, need not form an uninterrupted numeric sequence, and need not begin at 0. But the wizard will read only *Error<#>* parameters whose differentiating digits are within the range 0-99 inclusive.

[Exchange] section

[Exchange] AddFullAccessPermission=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	NMM	4.15.1

This value corresponds to the GUI element in the Notes Migration Manager, the **Automatically grant permissions** check box in the *Exchange Server* configuration screen. This parameter is available only for Microsoft 365 (Exchange Online) targets. (When the target is on-premises Exchange, the AddReceiveAsPermission parameter corresponds to the check box.)

When the target is Microsoft 365 and the check box is selected and applied, MNE checks to see if the Migration Account (or assigned Admin Pool account) has Full Access permission on the target mailbox. If it does not, MNE temporarily grants Full Access permission for the duration of the migration.

There can be a significant delay between granting Full Access permission and Microsoft 365 allowing the account to access the mailbox.

The following PowerShell cmdlets can be used to grant Full Access permission before a migration (and to revoke permission after the migration)

> Add-MNEMailboxAdminPermission

> Remove-MNEMailboxAdminPermission

This is the recommended method of granting permission to the admin account for the migration. If you are using the PowerShell cmdlets to grant access, disable the built-in mechanism by clearing the check box.

[Exchange] AddOnlineMeetingUrlScheme=<#>

Type:	Default:	Occurs in:
keyword (single digit 0, 1 or 2)	0	Data Migr

Permits prepending an http scheme to migrated online meeting URLs. The parameter value is a single-digit keyword that specifies which string, if any, to prepend to the URL:

    0: prepend nothing
    1: prepend *http://* if there is no http or https scheme
    2: prepend *https://* if there is no http or https scheme

By default (*AddOnlineMeetingUrlScheme=0*), Migrator for Notes to Exchange prepends nothing to the URL.

[Exchange] AddReceiveAsPermission=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI Entry]	NMM	4.16.1

This value corresponds to the GUI element in the Notes Migration Manager, the **Automatically grant permissions** check box in the *Exchange Server* configuration screen. This parameter is available only for on-premises Exchange targets. (When the target is Microsoft 365, the AddFullAccessPermission parameter corresponds to the check box.)

When the target is on-premises Exchange and the **Automatically grant permissions** check box is selected and applied, MNE checks whether the Exchange service account has Receive-As permission on the mailbox database container. If it does not have permission, MNE grants the Receive-As permission on the mailbox database container. MNE also verifies that the Exchange service account is *not* added to any administrative groups that are explicitly denied access to the mail stores. These groups include Enterprise Admins, Domain Admins, and the Organization Management role.

There can be a significant delay between granting Receive-As permission and Exchange allowing the account to access mailboxes, up to 30 minutes. Alternately, you could grant the permissions using the following PowerShell cmdlet:

    get-mailboxdatabase | add-adpermission -user <username> -extendedrights receive-as

However, if you grant permissions manually using PowerShell, you must reconfigure the account *each* time a new database is added. If you use the **Automatically grant permissions** option, MNE grants permissions on the database container and the permissions are inherited by all databases, even the databases that are added after initial configuration. If you are using the PowerShell cmdlet to grant access, disable the built-in mechanism by clearing the check box.

[Exchange] AddressListName=<NameOfList>

Type:	Default:	Occurs in:	New in:
string	All Users	Data Migr	4.1.5

Specifies the name of the identity parameter for the *UpdateAddressList* cmdlet, which the wizard will run after mailbox-enabling a collection if *UpdateAddressList=1* (also in this [Exchange] section). See the *UpdateAddressList* parameter description for more information.

[Exchange] AddressPolicyName=<NameOfPolicy>

Type:	Default:	Occurs in:	New in:
string	Default Policy	Data Migr	4.1.5

Specifies the name of the identity parameter for the *UpdateEmailAddressPolicy* PowerShell cmdlet, which the wizard runs when mailbox-enabling a collection if *UpdateEmailAddressPolicy=1* (also in this [Exchange] section). See the *UpdateEmailAddressPolicy* parameter description for more information.

[Exchange] AdjustTaskReminderToMidnight=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.15.1

In Notes and iNotes, when users set a task reminder to X days, hours, minutes before or after the task start date, the alarm notification is triggered X days, hours, minutes before or after 12:01 PM of the task start date.

When this parameter is set to the default value (1), after migration the alarm notification is triggered X days, hours, minutes before or after 12:00 AM instead of 12:01 PM.

To retain the Notes task alarm behavior and trigger the alarm before or after 12:01 PM, set this parameter to 0.

[Exchange] AdminAcctPoolFirstAccountSeq=<####>

Type:	Default:	Occurs in:	New in:
integer	1001	Data Migr, for Microsoft 365 migrations only	4.9

Associated with Migrator for Notes to Exchange's Admin Account Pool features (see the chapter "Microsoft 365 Admin Account Pool utility" in the Migrator for Notes to Exchange *Administration Guide*), this parameter specifies the number to assign to the first of a series of Admin Account Pool accounts grouped under the name specified by the *AdminAcctPoolRoleGroupName* parameter below.

[Exchange] AdminAcctPoolRoleGroupName=<GroupName>

Type:	Default:	Occurs in:	New in:
string	Notes Migrator Admins Role Group	Data Migr	4.9

Associated with MNE's Admin Account Pool features (see the chapter "Microsoft 365 Admin Account Pool utility" in the *MNE Administration Guide*), this parameter specifies the name of an Admin Role Group used to assign administration roles to the accounts in the Admin Account Pool. If the role group does not exist, the Microsoft 365 Admin Account Pool utility creates the group and assigns the following roles to the group:

- ApplicationImpersonation
- Mail Recipients
- Mail Recipient Creation
- Distribution Groups
- Security Group Creation and Membership

[Exchange] AdminAcctPoolUserNamePrefix=<UserName>

Type:	Default:	Occurs in:	New in:
string	Name of the Exchange admin user	Data Migr	4.16.1

Associated with the MNE Microsoft 365 Admin Account Pool feature, this parameter specifies the prefix of the name of Admin Account Pool users that are assigned administration roles through the Admin Pool Role Group. For more information, see the chapter titled "Microsoft 365 Admin Account Pool utility" in the *Migrator for Notes to Exchange Administration Guide*.

If parameter is missing or empty, the Microsoft 365 Admin Account Pool utility uses the name of the Exchange Admin user account as prefix with a sequence number suffix. Sequence numbers are specified by the AdminAcctPoolFirstAccountSeq parameter in addition with the prefix to create the Admin pool account name.

[Exchange] AdminDomain=<WinDomain>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager, the Administrator user domain text box in the *Exchange Server* configuration screen. The program writes this value to the Task Parameters from a GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value documents the Windows domain required for the administrator's MAPI profile. This field is required for silent-mode operation. For example:

    AdminDomain=sumptin.com

[Exchange] AdminMailbox=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Administrator SMTP address text box in the *Exchange Server Configuration* screen. The program writes this value to the Task Parameters from a GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] AdminPassword=<WinPassword>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Administrator password text box in the *Exchange Server Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value documents the Windows password required for the administrator's MAPI profile. This field is required for silent-mode operation. For example:

    AdminPassword=Malcolm1863

[Exchange] AdminProfile=<AlphanumString>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[Exchange] AdminUsername=<WinUsername>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the Administrator user name text box in the *Exchange Server Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value documents the Windows username required for the administrator's MAPI profile. This field is required for silent-mode operation. For example:

AdminUsername=WilburBurns

[Exchange] AllowExternalOOF=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1 or 2)	0	Data Migr	4.14.1

Works in conjunction with [ServerData]OOF which controls if out-of-office messages are migrated from Notes. By default, [ServerData]OOF is set to 0, meaning out-of-office messages are not migrated. When [ServerData]OOF=1, then [Exchange]AllowExternalOOF and its assigned value is applied.

Valid values are the following single-digit integers:

0 (default): Automatic Replies are not sent to any external senders. Equivalent to disable external auto reply.

1: Automatic Replies are sent only to external senders that are specified in the Contact list of the mailbox. Equivalent to my contacts only.

2: Automatic Replies are sent to all external senders. Equivalent to anyone outside my organization.

If the value is set to anything but 0, 1 or 2, the setting defaults to 0.

[Exchange] AllowHTMLCalendarBodies=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.4.1

Determines whether HTML information in the Description field of calendar appointments and tasks will migrate. The default:

AllowHTMLCalendarBodies=1

… tells the wizard to migrate such information. The feature can be disabled by *AllowHTMLCalendarBodies=0*.

[Exchange] AllowO365MailboxMaxMessageSize=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.1

When migrating to Microsoft 365, if you set this parameter to 1, MNE checks the target mailbox settings for message size restrictions against the maximum message size allowed for sending and receiving messages in the Exchange Online mailbox. If the current set message size is smaller than the maximum message size allowed (such as 153600 KB bytes), during the migration MNE temporarily sets the message size to the maximum limit allowed for the target mailbox. MNE restores the original message size restrictions at the end of the migration.

By default, the parameter is set to off (0). If user data migration results in a specific MaxSubmissionExceeded error and a large message cannot be migrated to the Exchange Online mailbox because the message size restriction (default is 35 MB) is smaller than the maximum size limit allowed, it is recommended that you set the maximum size limit allowed well before migration starts (to allow for the propagation delay). You can use the PowerShell command "Set-Mailbox Identity -MaxReceiveSize 150MB -MaxSendSize 150MB" to set the maximum allowed limit before migration starts.

Alternately, you can set the AllowO365MailboxMaxMessageSize parameter and remigrate the message. It is recommended that you use the [Exchange] MigrateOversizedAttachments parameter to migrate large message attachments to the OneDrive store, resulting in smaller message sizes and increasing the chance for the message to be migrated to the target without hitting the size limit.

[Exchange] AllowSelfSignedCerts=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.15.1

Determines whether or not the signer of the Exchange server certificate is verified against the list of trusted root certificate authorities. This setting is applied when performing calls to the Autodiscover service, and when connecting with MAPI using the Outlook Anywhere protocol. This setting can be useful when evaluating the product in a test lab where the Exchange servers have not been configured with properly signed certificates.

This parameter is used when migrating with the MNE MAPI/HTTP library or with Outlook MAPI. If you are migrating with Outlook MAPI, this parameter is used only when migrating with Outlook 2010 or 2013.

[Exchange] AlwaysDoForwarding=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1 or 2)	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Overwrite existing mail forwarding address radio buttons in the Specify Exchange to *Notes Mail Forwarding Settings* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support. The parameter value tells the wizard whether to set, update or remove mail forwarding, per the administrator's instructions in other program entries, even if the wizard detects an existing forwarding address or rule already in place for a particular user. Valid values are single-digit integer:

> 0 (default): The wizard will not set, update or remove existing forwarding unless the new forwarding domain matches the domain of the existing forwarding address—a precaution to prevent the inadvertent overwriting or removal of existing forwarding rules that have nothing to do with migration.

> 1: The wizard will always change any existing forwarding, regardless of the existing forwarding address.

> 2: The wizard will never change any existing forwarding.

[Exchange] AlwaysRmvForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Remove existing forwarding address** radio buttons in the *Specify Remove Exchange Forwarding Settings* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support. The boolean parameter value tells the wizard whether it should refrain from removing an existing forwarding address or rule in Exchange if its domain does not match a *ForwardingDomain* parameter value (also in this [Exchange] section, and also derived from a GUI entry in the same screen):

> 0: Remove forwarding only if domain matches.
> 1: Always remove forwarding, regardless of domain.

[Exchange] AlwaysUseDefaults=<#>

Type:	Default:	Occurs in:
boolean	0	NMM, AD Grps, Prov, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager, the **Always use these values** check box in the *Exchange Server* configuration screen. The value determines whether the wizards that need this information will always use the access credentials entered into the corresponding *Active Directory* configuration screen. For example, if:

> AlwaysUseDefaults=1

... a wizard will skip the screen that requests this information, saving the admin the trouble of having to reenter the values and manually dismiss the screen. By default (*AlwaysUseDefaults=0*), the wizard will take the values entered in Notes Migration Manager as its defaults, but will display the screen to offer the option of accepting or changing the default credentials.

[Exchange] AppendSMTPAddressToContactsDisplayName=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Tells the wizard whether to automatically write the display names of Notes' email 2 and email 3 in the form Display Name (SMTP Address)— e.g., Joe Example (joeex@email.com). This feature, intended to make type-ahead easier to use, is off (0) by default, but can be enabled by:

    AppendSMTPAddressToContactsDisplayName=1

[Exchange] ArchiveResolveAttendees=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

This setting applies to data being migrated to a PST file. It tells the Data Migration Wizard to do an Exchange GAL lookup of attendees of migrated items to retrieve their Exchange addresses. Successfully resolved attendees are migrated to the target using their Exchange addresses instead of their SMTP addresses. This is required for free-busy lookups to succeed.

You can disable this feature by setting the parameter to 0. For example, to migrate data to PST files without connecting to the Exchange server, set:

    ArchiveResolveAttendees=0

... and also, in the [General] section:

    [General]
    PABDest=PST
    ServerMailDest=PST
    Type=PST
    PublicDelegates=0

[Exchange] AuthMechanismType=<keyword>

Type:	Default:	Occurs in:	New in:
keyword	kerberos	Data Migr, Prov	4.4

Determines an authentication mechanism for remote PowerShell calls by Migrator for Notes to Exchange applications.

Kerberos is the default for on-premises Exchange targets. For Exchange Online, ModernAuthentication is the default. NME supports Basic and ModernAuthentication so if other values are specified, they are ignored and default to ModernAuthentication.

You can specify another method by entering the name as the keyword parameter value (case-insensitive). The valid keyword values are:

basic	default	kerberos	negotiateWithImplicitCredential
credssp	digest	ModernAuthentication	negotiate

You can find descriptions for these keyword values, except for ModernAuthentication, in this Microsoft link.

[Exchange] AutodiscoverDisableMapiHttp=<#>

Type:	Default:	Occurs in:	New in:
boolean	• On premises: 1 • Microsoft 365: 0	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

When using the Autodiscover service to configure the MAPI profile (i.e. `[Exchange] UseAutodiscoverCreateProfile=1`), the protocol that the profile is configured to use is selected based on the results of an Autodiscover query performed when the profile is being created. The effect of this parameter depends on the version of Outlook installed on the MNE server:

- **Outlook 2010:** MNE does not support the MAPI/HTTP protocol when migrating with Outlook 2010. The MAPI/HTTP protocol will never be selected when migrating to on-premise Exchange servers. MNE does not support migrating to O365 with Outlook 2010.

- **Outlook 2013:** The AutodiscoverDisableMapiHttp parameter can be used to prevent the MAPI/HTTP protocol from being selected when the MAPI profile is being created.

- **Outlook 2016 and Outlook 2019:** The protocol used by Outlook is selected by MAPI when the MAPI connection is opened, however the protocol selected can be influenced through a registry setting (see the notes below).

> **i** | **NOTE:** As of October 31 2017, Microsoft 365 no longer supports the RPC/HTTP protocol. MAPI/HTTP is the only MAPI protocol supported by Microsoft 365.
>
> **NOTE:** When migrating with Outlook 2013, Outlook 2016, or Outlook 2019, the registry value `[HKEY_CURRENT_USER\Software\Microsoft\Exchange] MapiHttpDisabled` is automatically modified by MNE to match the configuration provided by this parameter setting.

[Exchange] AutodiscoverEnableScpLookup=<#>

Type:	Default:	Occurs in:	New in:
boolean	• O365: 0 • On premise: 1	Data Migr	4.15.1

This parameter is used when migrating with the MNE MAPI/HTTP library or with Outlook MAPI. If you are migrating with Outlook MAPI, this parameter is used only when migrating with Outlook 2010 or 2013.

When Outlook MAPI is used and you are using the Autodiscover service to configure the MAPI profile (i.e. `[Exchange] UseAutodiscoverCreateProfile=1`), the Autodiscover endpoint must first be found. When migrating to an on-premises Exchange server, the correct Autodiscover endpoint can be quickly obtained by querying the appropriate Service Connection Point (SCP) object in AD. To bypass the SCP query and immediately fall back to using the domain portion of the admin user SMTP address to infer the Autodiscover endpoint, you can set this parameter to 0.

This parameter is used only if the parameter `[Exchange] AutodiscoverUrl` is not configured with a value.

[Exchange] AutodiscoverMaxHops=<#>

Type:	Default:	Occurs in:	New in:
integer	10	Data Migr	4.15.1

Specifies the maximum number of HTTP redirects allowed when resolving the URL of the Autodiscover service. This parameter is ignored if the Autodiscover URL is specified with the `[Exchange] AutodiscoverUrl` parameter.

This parameter is used when migrating with the MNE MAPI/HTTP library or with Outlook MAPI. If migrating with Outlook MAPI, this parameter is used only when migrating with Outlook 2010 or 2013.

[Exchange] AutodiscoverPreferInternalRpcHttpUrl=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

The Autodiscover service may return two URLs for connecting with RPC over HTTP; one for connecting from within the internal network, and another for connecting from the Internet. By default, MNE selects the internal URL when migrating to an on-premises target. This parameter can be used to override the default behavior. To override the default behavior, set `AutodiscoverPreferInternalRpcHttpUrl=0`.

This parameter has no impact when migrating to Microsoft 365.

[Exchange] AutodiscoverPreferInternalUrl=<#>

Type:	Default:	Occurs in:	New in:
boolean	1 (on-premises) or 0 (Microsoft 365)	Data Migr	4.16.0

The Exchange Autodiscover service can return two sets of URLs in its query responses:

- Internal URLs
- External URLs

If this parameter is not configured, MNE selects the URL that is appropriate to the location of the mailbox. If the mailbox is on an on-premises Exchange server, MNE gives preference to the internal URLs. If the mailbox is an online mailbox in Microsoft 365, MNE gives preference to the external URLs.

This default behavior can be overridden by setting this parameter to 1 (prefer internal URL) or 0 (prefer external URL. See the following examples:

- Set `AutodiscoverPreferInternalUrl=0` to prefer external URLs.
- Set `AutodiscoverPreferInternalUrl=1` to prefer internal URLs.

> **i** | **NOTE:** if the Autodiscover service returns only a single URL, internal or external, that URL is used regardless of this setting.

[Exchange] AutodiscoverUrl=<x>

Type:	Default:	Occurs in:	New in:
string	• O365: https://autodiscover-s.outlook.com/autodiscover/autodiscover.svc • On premise: [None]	Data Migr	4.15.1

This parameter is used when migrating with the MNE MAPI/HTTP library or with Outlook MAPI.

If migrating with Outlook MAPI, MNE configures the temporary MAPI profiles that it creates using data obtained through the Exchange Autodiscover service. The URL of the service can be discovered dynamically, but this adds extra overhead to each Autodiscover query. Performance of these queries can be improved by providing the URL of the Autodiscover service through the `AutodiscoverUrl` parameter.

When migrating to O365, this setting is updated by the Migration Console when the Apply button is clicked on the Exchange Server page. The URL associated with the selected Microsoft 365 Environment is chosen from the list of URLs in the **[MsOnlineAutodiscoverUrls]** section.

[Exchange] AzureADAuthorizationEndPointUri =<URL>

Type:	Default:	Occurs in:	New in:
string	https://login.microsoftonline.com/common	Data Migr	4.16.0

Identifies the URL of the Azure Active Directory authorization endpoint. This setting is updated by the Migration Console when the Apply button is clicked on the Exchange Server page. The URL associated with the selected Microsoft 365 Environment is chosen from the list of URLs in the **[AzureADAuthorizationEndPointUris]** section.

[Exchange] AzureApplicationClientId=<registered_App_Client_ID>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.16.1

Identifies the registered application client ID for the Microsoft Azure portal. This setting is updated by the Migration Console when the Apply button is clicked on the Exchange Server page after the user has performed an App Registration and successfully registered Migrator for Notes to Exchange with the Microsoft Azure portal.

To migrate oversized attachments or messages, this parameter is required when [Exchange] MigrateOversizedAttachments is enabled so the tool can access and upload large attachments to the OneDrive store owned by the mailbox user.

[Exchange] AzureApplicationClientSecret=<registered_App_Client_Secret>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.16.1

The parameter value documents the Microsoft Azure Application client secret that is required when [Exchange] MigrateOversizedAttachments is enabled so that the tool can access the OneDrive store for a user mailbox when the option to migrate oversized attachments is enabled for Microsoft 365 target. This field is required for migration with Admin console. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] CalMaxRecurrenceFix=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1 or 2)	0	Data Migr	4.3

Specifies the method the wizard should use to process a recurring meeting series that contains more occurrences in Notes than the 999 maximum allowed by Exchange. Without this new control, attempts to migrate such meetings to Exchange 2010 would fail when the number of recurring instances exceeded the Exchange maximum. For example:

```
[Exchange]
CalMaxRecurrenceFix=1
```

... tells the wizard to convert the item to a recurring series with no end date, which migrates cleanly.

The parameter value is a keyword that must be one of these single digits:

0 (default): The item is migrated as-is. (Migration to Exchange 2010 will fail for series with > 999 occurrences.)

1: The wizard converts the item to a recurring series with no end date, which migrates cleanly.

2: The wizard converts the item to a recurring series with 999 occurrences (the Exchange maximum).

A migrated appointment will appear in Outlook with the same number of occurrences as in Notes, until the recurrence pattern is edited by the user, at which time it will assume the option set by this parameter.

[Exchange] CheckMigratedItemsOnFolderLevel=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.1

This parameter is used only when migrating using MNE MAPI/HTTP. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

Tells the Data Migration Wizard to check if the Notes items are already migrated to Exchange based on the folder level or mail store level. This parameter allows you to avoid creating duplicate items in Exchange by using the [Exchange] RemigrateMode parameter.

For example, the default value (CheckMigratedItemsOnFolderLevel=1) tells the data migration wizard to check if the Notes items have already been migrated based on the folder level. CheckMigratedItemsOnFolderLevel=0 tells the data migration wizard to check if the Notes items have already been migrated based on the mail store level.

[Exchange] CreateMailbox=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Mailbox-enable ... accounts** check box in the *Operations* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] DeleteAutocompleteMessages=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines whether the wizard will delete the IPM.Configuration.Autocompletion message from the Inbox at the end of its data migration run. The AutoCompletion configuration message holds the cache of recently mailed-to users, but will cause errors in Outlook if the auto-completion lookup tables are corrupted—in which case Outlook will mistakenly tell users that valid addresses are invalid. The feature is off by default (*DeleteAutocompleteMessages=0*), but can be enabled by setting: *DeleteAutocompleteMessages=1*

[Exchange] DirSyncEnableRemoteMailbox=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.7

This parameter and another (*LocalExchangeFederationServer*, also in this [Exchange] section) together support hybrid Microsoft 365 migration (O365 provisioned by a local proprietary AD) with a local Exchange server and remote mailboxes (on O365) for some or most users. *DirSyncEnableRemoteMailbox* is a boolean parameter that, when enabled (1), tells the Data Migration Wizard to read the *LocalExchangeFederationServer* value to remote-mailbox-enable each principal provisioned during AD prep on the local Exchange. This feature therefore requires a valid FQDN value for *LocalExchangeFederationServer*, as described in that parameter entry below.

Note that this remote-mailbox-creation feature in preparing AD for AD sync does not support any settings associated with regular mailbox creation. For example, [Exchange] *EmailAddressPolicyEnabled* is not supported.

[Exchange] DisableCredentialScanner=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

When opening a MAPI connection, Outlook may present a dialog to request login credentials. MNE scans for this login dialog and when it finds it, automatically enters the Exchange Administration account credentials. In certain scenarios it may be useful to temporarily disable this mechanism (`DisableCredentialScanner=1`) to allow the user to manually enter the login credentials.

[Exchange] DisableDialogScanner=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

When opening a MAPI connection, there are several dialogs that may be presented by Outlook in specific scenarios. MNE scans for these dialogs and attempts to handle them automatically. Some customers have experienced issues with this mechanism interfering with the Credential Scanner mechanism. If this happens, the Dialog Scanner mechanism can be disabled (`DisableDialogScanner=1`).

[Exchange] DisableModernAuthentication=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.0

When connecting to the target mailbox, MNE must authenticate with the Exchange Server or Microsoft 365. MNE automatically selects the correct type of authentication to use based on the authentication mechanisms that are enabled on the server. If the server supports Modern Authentication, it is selected as the preferred authentication mechanism.

Disable Modern Authentication by setting `DisableModernAuthentication=1`. When disabled, MNE will fall back on another one of the mechanisms supported by the server (e.g. Basic Authentication).

Modern Authentication is primarily used when migrating to Microsoft 365. Microsoft does support using Modern Authentication with on-premises Exchange servers in a Hybrid Authentication configuration. However, MNE has not been validated for use with Hybrid Authentication. If you run into issues, you may need to disable Modern Authentication using this parameter.

[Exchange] DoRmvForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Remove mail Forwarding address check box in the *Specify Remove Exchange Forwarding Settings* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] DoSetForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Set Mail Forwarding address check box in the *Specify Exchange to Notes Mail Forwarding Settings* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] DoShowRmvForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to GUI elements in the *Specify Mail Routing Options* screen of the Data Migration Wizard, the **Notes** vs. **Exchange** radio buttons under **All new mail ... will be delivered to**. The wizard automatically sets the values of this and three other related parameters (shown below) according to the administrator's radio-button choice, to tell the wizard which mail-routing screens to display in the current run. This *DoShowRmvForwarding* value in the [Exchange] section determines whether the wizard will (1) or will not (0) display its *Specify Remove Exchange Forwarding Settings* screen. The full set of related parameters, and how they are set:

If Notes destination is selected:	If Exchange destination is selected:
[Exchange] DoShowSetForwarding=1 DoShowRmvForwarding=0	[Exchange] DoShowSetForwarding=0 DoShowRmvForwarding=1
[Notes] DoShowSetForwarding=0 DoShowRmvForwarding=1	[Notes] DoShowSetForwarding=1 DoShowRmvForwarding=0

Quest recommends you do not manually enter or change these parameter values except at the direction of Quest Support.

[Exchange] DoShowSetForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to GUI elements in the *Specify Mail Routing Options* screen of the Data Migration Wizard, the **Notes** vs. **Exchange** radio buttons under **All new mail ... will be delivered to**. The wizard automatically sets the values of this and three other related parameters (shown below) according to the administrator's radio-button choice, to tell the wizard which mail-routing screens to display in the current run. This *DoShowSetForwarding* value in the [Exchange] section determines whether the wizard will (1) or will not (0) display its *Specify Exchange to Notes Mail Forwarding Settings* screen. The full set of related parameters, and how they are set:

If Notes destination is selected:	If Exchange destination is selected:
[Exchange] DoShowSetForwarding=1 DoShowRmvForwarding=0	[Exchange] DoShowSetForwarding=0 DoShowRmvForwarding=1
[Notes] DoShowSetForwarding=0 DoShowRmvForwarding=1	[Notes] DoShowSetForwarding=1 DoShowRmvForwarding=0

Quest recommends you do not manually enter or change these values except at the direction of Quest Support.

[Exchange] EmailAddressPolicyEnabled=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.4.2

Determines whether the wizard should, after mailbox-creation, set the newly created mailboxes to Automatically update e-mail addresses based on e-mail address policy. This is an Exchange feature offered in the Exchange Management Console, as a check box on the *E-Mail Addresses* tab of the *Data Properties* for each mailbox. This Migrator for Notes to Exchange parameter specifies whether the wizard should automatically enable or disable that Exchange feature during mailbox-creation. For example, the default:

    EmailAddressPolicyEnabled=1

… tells the wizard to enable the Exchange automatic-update feature (mark the Exchange check box). To disable the Exchange feature (unmark the Exchange check box), set *EmailAddressPolicyEnabled=0*. **Note:** When mailbox-enabling, make sure the setting for this *EmailAddressPolicyEnabled* parameter matches the setting for [ActiveDirectory] *SetRecipPolicy*.

[Exchange] EnableRemoteArchiveMailbox=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.7

Determines whether the Data Migration Wizard will create mailbox archives in a hybrid Microsoft 365 scenario (O365 provisioned by a local proprietary AD) when mailbox-enabling the remote mailboxes (on O365). The feature can be enabled by *EnableRemoteArchiveMailbox=1*, but only if remote mailbox-enabling is also enabled for this scenario by *DirSyncEnableRemoteMailbox* (also in this [Exchange] section, described separately above).

[Exchange] EncryptedItemCategory=<CategoryName>

Type:	Default:	Occurs in:	New in:
string	[null]	Data Migr	4.7

Enables or disables the feature to designate all migrating encrypted items as a particular Outlook category, which makes it possible to identify encrypted items in Outlook by a category search. The parameter value is a string that names the Outlook category. The feature is disabled by setting the parameter value to null or omitting the parameter altogether. The parameter is omitted by default.

[Exchange] ExtractEmbeddedImages=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.11

Enables or disables an option to extract images from Notes messages and replace and migrate the images as OLE Device Independent Bitmap object attachments -OR- migrate the original images to a OneDrive store. Original images are migrated to OneDrive when the following conditions are met:

- migration target is Microsoft 365

- *[Exchange] MigrateOversizedAttachments* is set to 1 (enabled)

- extracted image sizes are larger than the value specified by *[Filter] AttachSize*.

    The *[Filter] AttachSize* parameter corresponds to the **Attachment sizes** filter on the "Specify Dates and Size Filters" page in the Migrate User Data wizard.

This option makes images renderable in both OWA and the Office web client and is enabled by default (1). To disable the option, set *ExtractEmbeddedImages=0*.

TIP: If an OLE Device Independent Bitmap uses significantly more storage than the original source image, you could reduce the storage requirements by using the *MaxExtractedImageArea* parameter.

[Exchange] FilterAddressReplacementChar=<Alphanumeric Character>

Type:	Default:	Occurs in:	New in:
string	None	Dir Exp, Data Migr	4.16.1

This internal parameter is a single alphanumeric character that used to replace invalid characters when MNE builds an Microsoft 365 address. Use this parameter only at the direction of Quest support.

NOTE: SPACE is always replaced by UNDERSCORE; this replacement is not controlled by the FilterAddressReplacementChar parameter.

[Exchange] ForwardingAddress=<value>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[Exchange] ForwardingDomain=<DomainName>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Forwarding mail domain** text box in the *Specify Exchange to Notes Mail Forwarding Settings* screen, and the **Forwarding mail domain** text box in the *Specify Remove Exchange Forwarding Settings* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] FwdAddrDelim=<x>

Type:	Default:	Occurs in:
string	. [period character]	Data Migr

Specifies the character used to delimit the elements of Exchange-to-Notes forwarding addresses, when the Data Migration Wizard composes forwarding addresses. For example:

    FwdAddrDelim=,

... tells the wizard to use a comma to delimit the elements of the forwarding address. By default, the wizard uses a period as the delimiter.

[Exchange] FwdAttrField=<ValidKeyword>

Type:	Default:	Occurs in:	New in:
keyword	TargetAddress	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Build address from** drop-down list box in the *Specify Exchange to Notes Mail Forwarding Settings* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support. The parameter specifies the method by which the Data Migration Wizard will compose forwarding addresses from Exchange to Notes. For example:

    FwdAttrField=SourceAddress

... specifies the *SourceAddress* method, as described below. By default the wizard will use the *TargetAddress* method, which also is the method used in pre-3.1 versions of the program. The three valid parameter values are:

- *TargetAddress* (default): The left-hand side (LHS) of the *TargetAddress* column in the data table becomes the LHS of the forwarding address, to which the wizard appends the **Forwarding Domain** specified in the user interface during the program run.
- *SourceAddress:* The *SourceAddress* column in the data table becomes the left-hand side (LHS) of the forwarding address, to which the wizard appends the **Forwarding Domain** specified in the user interface during the program run.
- *ForwardingAddress:* The *ForwardingAddress* column in the data table becomes the forwarding address.

For the *TargetAddress* and *SourceAddress* options the delimiter character is usually a "dot" (period), but is configurable by the *FwdAddrDelim* parameter in this same [Exchange] section.

[Exchange] GrantResourceOwnerFullAccess=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.7

Determines whether the Data Migration Wizard will add resource-owner permissions to resource delegates in Exchange who are migrating from Notes via the *MigrateResourceDelegation* parameter (also in this [Exchange]

section, see below). This feature is off (0) by default. To add resource-owner permissions to migrating resource delegates, set *GrantResourceOwnerFullAccess=1*.

Note: This feature requires *MigrateResourceDelegation=1*, as described in that separate entry below. The wizard will ignore this *GrantResourceOwnerFullAccess* parameter if *MigrateResourceDelegation=0*.

[Exchange] HostedDomain=<DomainName>

Type:	Default:	Occurs in:
boolean	[none]	NMM

This value corresponds to a GUI element in the Notes Migration Manager's *Exchange Server Configuration* screen: the Microsoft 365 User domain drop-down list, used to specify the Microsoft 365 domain that should be used to compose users' Microsoft Online Services ID (logon names and email addresses). The program writes this value to the Task Parameters based on an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support. The program loads this drop-down list with domains registered in Microsoft 365 for the admin credentials entered elsewhere on the same screen. The Microsoft 365 User domain specified here will be the portion of each user's email address that follows the @ symbol. The left-hand-side of each user's ID will be his/her User ID from Migrator for Notes to Exchange's SQL database.

[Exchange] LocalExchangeFederationServer=<LocalExchangeFQDN>

Type:	Default:	Occurs in:	New in:
string	[null]	Data Migr	4.7

This parameter and another (*DirSyncEnableRemoteMailbox*, also in this [Exchange] section) together support hybrid Microsoft 365 migration (O365 provisioned by a local proprietary AD) with a local Exchange server and remote mailboxes (on O365) for some or most users. This *LocalExchangeFederationServer* value is a string for the FQDN of your local Exchange, which the program will need if *DirSyncEnableRemoteMailbox=1* to remote-mailbox-enable each principal provisioned during AD prep on the local Exchange.

AD credentials are used for this feature because Migrator for Notes to Exchange does not ask for separate credentials for the local Exchange. The AD admin must therefore be a member of Organization Management to run *EnableRemoteMailbox* on the local Exchange.

[Exchange] LogSkippedTestMapiConnectivity=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.1

You can specify [Exchange] LogSkippedTestMapiConnectivity=1 to log warning messages in the GALSearch.wlog log file if the MAPI Connectivity tests are skipped.

[Exchange] MapiAdminProfile="<ProfileName>"

Type:	Default:	Occurs in:	New in:
string	none	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

The name of an existing Outlook profile on the Migrator for Notes to Exchange admin migration computer that the Data Migration Wizard should use to access the migration target. You may use this setting when migrating to specify a specific profile to use, rather than dynamically creating a temporary profile to use for the migration. For example:

    [Exchange]
    MapiAdminProfile="Outlook Profile"

The quotation marks enclosing the profile name may be omitted if there is no space in the profile name.

IMPORTANT: The specified profile must be configured with the **Use Cached Exchange Mode** option disabled.

NOTE: This parameter is overridden by the `[Exchange] UseAdminAcctPool` parameter. When migrating with an account pool, each migration thread will dynamically create a temporary MAPI profile to be used by that migration thread.

NOTE: This parameter replaces the older `[Exchange] RPCAdminMapiProfile` parameter which has been deprecated. Additionally there is no longer any need to enable the profile through a separate parameter as was previously necessary using the `[Exchange] RPCUseAdminMapiProfile` parameter. It is sufficient to simply provide the name of the profile to be used.

[Exchange] MAPIRetryCount=<#>

Type:	Default:	Occurs in:	New in:
integer	The value specified by the `[Exchange] MessageRetryCount` parameter	Data Migr	4.15.1.257

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

Determines the number of additional attempts that MNE will make to recover from a MAPI API function that fails with one of the errors listed in the `MAPIErrorsToRetry` parameter. If a MAPI retry error occurs, MNE waits for the amount of time specified by the `MessageRetryWait` parameter, and attempts to run the MAPI API function again.

If the API function continues to fail and returns MAPI retry errors, once the `MAPIRetryCount` limit is reached MNE makes a new attempt to store the message using a new MAPI session, as described by the `MessageRetryCount` parameter.

If this parameter is not set, it defaults to the value that is specified by the `MessageRetryCount` parameter.

[Exchange] MAPIUseSharedProfile=<#>

Type:	Default:	Occurs in:	New in:
boolean	• On premises: 1 • Microsoft 365: 0	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This setting determines whether each migration worker thread shares a single dynamically created MAPI profile or, if separate MAPI profiles are created for each thread. This setting was added as a workaround to a MAPI bug that prevents the re-use of MAPI profiles when the MAPI over HTTP protocol is used. MAPI over HTTP is the only MAPI protocol available for use with Microsoft 365 as of October 31, 2017. When migrating to Microsoft 365, each migration worker thread will create its own temporary MAPI profile for its exclusive use.

By default, migrations to on-premises Exchange servers will continue to use the RPC over HTTP protocol with the `MapiUseSharedProfile` option enabled. This default value will be changed in the future once Microsoft has released an update to MAPI resolving the MAPI over HTTP issue.

This setting will be overridden by the following parameter settings:

- **[Exchange] UseAdminAcctPool:** When the use of an Admin Account Pool is enabled, the use of a shared MAPI profile is disabled, regardless of the `MapiUseSharedProfile` setting.

- **[Exchange] MapiAdminProfile:** If a manually created MAPI profile is specified, no dynamic MAPI profiles are created. The manually created profile is always be used.

NOTE: The MAPI over HTTP bug does not affect profiles created through the Control Panel.

[Exchange] MaxExceptionsPerMessage=<##>

Type:	Default:	Occurs in:	New in:
integer	200	Data Migr	4.15.1

Recurring-meeting messages from Notes with more than 255 attachments are divided into individual meetings in Exchange, according to the setting for this parameter. The value of this parameter represents the maximum number of attachments the wizard may encounter before creating a new meeting. The wizard will create as many meetings as necessary to migrate the complete series with no more than the specified number of exceptions. For example:

MaxExceptionsPerMessage=200

… tells the wizard to create as many meetings as necessary to migrate the series with no more than 200 exceptions per message.

[Exchange] MaxExtractedImageArea=<##>

Type:	Default:	Occurs in:	New in:
integer	0	Data Migr	4.15.1.172

This setting is applied when the *[Exchange] ExtractEmbeddedImages parameter* is enabled.

During migration, images that are extracted from emails are either converted to BMP images before being stored in Exchange as message attachments -OR- the original images are uploaded to the user's OneDrive store.

Converting an image to BMP format can result in an image that has a data size many times larger than the original image. Due to the technical limitations of RTF format, it is not possible to use other, more efficient image formats that support data compression.

To mitigate the impact to the target mailbox size by emails that contain large embedded images, you can use the *MaxExtractedImageArea* setting to specify the maximum allowable image area, in pixels, of the generated BMP image. During the conversion, if the limit is exceeded, the embedded image is removed from the email body and is replaced with the original Notes image stored as a standard file attachment on the migrated message.

For example, to specify that images larger than 640 x 480 (307200) pixels should be removed from the email body and migrated as file attachments, set MaxExtractedImageArea=307200. However, if you set extracted images to be migrated to a OneDrive store, the parameter is ignored.

By migrating the source image in its original format and storing it in Exchange as a message attachment, the source image data compression is retained with no loss in image quality. Though the image is no longer displayed in the email body in Outlook or OWA, users can open the images from the email client to view the image content.

Original images are uploaded to OneDrive if the *Migrate Oversized Attachments* option is enabled for Microsoft 365 mailbox migration and the extracted image sizes exceed the limit specified by the *[Filter] AttachSize* parameter.

When *MaxExtractedImageArea=0*, the image is migrated to Exchange with no size limit applied.

[Exchange] MaxMailboxConnectionRetryWaitTime=<#>

Type:	Default:	Occurs in:	New in:
integer	5	Data Migr	4.16.0

When MNE fails to connect to the target mailbox due to an error that might be transient (such as a network communication fault), MNE will make additional attempts to connect to the target mailbox. This parameter imposes a limit on the amount of time that MNE will spend retrying to open the connection.

The maximum time is specified in minutes. If the connection cannot be established within the amount of time specified, the migration to the target mailbox will be abandoned.

[Exchange] MaxSessionReconnectCount=<#>

Type:	Default:	Occurs in:	Updated in:
integer	20	Data Migr	4.15.1.257

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

Determines the maximum number of times that MNE will attempt to reconnect the MAPI session if a message fails to migrate due to one of the errors that are specified by the MAPIErrorsToRetry parameter. MNE pauses between each reconnect attempt for the number of seconds specified by the MessageRetryWait parameter.

If MNE is unable to open a new MAPI session after MaxSessionReconnectCount attempts, the migration is abandoned.

[Exchange] MessageRetryCount=<#>

Type:	Default:	Occurs in:	Updated in:
integer	2	Data Migr	4.15.1.257

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

If a message fails to migrate due to one of the MAPI errors specified by the MAPIErrorsToRetry parameter, this parameter determines the maximum number of additional attempts that MNE will make to store the message. When MNE fails to store a migrated message to the target mailbox due to a MAPI retry error, MNE closes the existing MAPI session, opens a new session, and attempts to store the message again.

If MNE is unable to open a new MAPI session, it continues to make additional attempts to connect with MAPI, as described by the MaxSessionReconnectCount parameter. MNE pauses between each reconnect attempt for the number of seconds specified by the MessageRetryWait parameter.

If MNE is able to successfully open new MAPI sessions, but attempts to store the message continue to fail and the MessageRetryCount limit is reached, MNE logs the MAPI error and the failure to migrate the current message. MNE proceeds to the next message to be migrated.

[Exchange] MessageRetryWait=<##>

Type:	Default:	Occurs in:	New in:
integer	30	Data Migr	4.6

Sets the delay (in seconds) between retry attempts for MAPI API functions that fail with one of the errors specified by the MAPIErrorsToRetry parameter, as documented by the MAPIRetryCount parameter.

The parameter also specifies the delay (in seconds) between MAPI session reconnect attempts, as documented by the MessageRetryCount parameter.

[Exchange] MigrateAllowedSendersOrMembers=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.1

Controls an Active Directory setting for authorized senders to provisioned groups. When the parameter is set to the default value 1, the Exchange distribution group restricts users who can send messages to the group to those users who are authorized senders for the distribution group in Domino/Notes. When set to 0, the restriction is not set which allows this recipient group to accept messages from all senders.

[Exchange] MigrateDeletedItemsToOtherFolders=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.6

Determines whether the Data Migration Wizard will migrate a Notes document that appears in the Trash view if it also appears in some other Notes view. By default:

    MigrateDeletedItemsToOtherFolders=0

... tells the wizard to skip such messages. The alternative (1) tells the wizard to always migrate Notes documents to their corresponding Exchange folders, even if they also appear in the Notes trash view.

[Exchange] MigrateMailInDBOwner=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.7

Determines whether the Data Migration Wizard will migrate the identities of mail-in database owners when it migrates mail-in DBs. The Directory Export Wizard captures these owner identities to Migrator for Notes to Exchange's SQL database in any case, but the migration of the identities to Exchange is an option that is enabled or disabled by this boolean program parameter.

By default (*MigrateMailInDBOwner=1*), the wizard will migrate the identities of mail-in DB owners. To disable this feature, set *MigrateMailInDBOwner=0*.

[Exchange] MigrateMeetingFYIAsResource=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.13

Determines whether MNE will migrate the FYI attendees of a Notes meeting to the *bcc* field in Exchange, where they will appear as Resources, instead of to the *cc* field. This option keeps FYI attendees hidden if the organizer later changes the meeting, since Exchange sends notifications of such changes, and those notices would otherwise disclose the FYI attendees as *Optional Attendees*.

By default (*MigrateMeetingFYIAsResource=1*), MNE migrates FYI attendees of a Notes meeting to the *bcc* field in Exchange. You can disable the feature (0) to make MNE migrate FYI attendees to the *cc* field.

[Exchange] MigrateOversizedAttachments=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0 or 1)	0	Data Migr	4.16.1

Used only when migrating with the MNE MAPI/HTTP library, which is used when the [Exchange] UseMneMapiHttpLib parameter is set to the default setting of 1 as in [Exchange] UseMneMapiHttpLib=1.

Tells the Data Migration Wizard whether to migrate an oversized message or an oversized message attachment when target is Microsoft 365. For example:

    MigrateOversizedAttachments=0

... tells the wizard to skip migrating the message attachment or the message that exceeds the size limit (such as. 25 MB for message attachments or 150 MB for messages) to the Exchange Online target.

The parameter value is a single-digit integer which must be one of these two valid values:

    0 (default): Skips migrating attachments that exceed the limit imposed by Microsoft 365 for the mailbox. Placeholder attachments are created instead that show the attachment is too large to be migrated directly to Exchange Online.

    1 Migrates the oversized attachments to the Microsoft 365 OneDrive store owned by the mailbox user and provides a web link to the attachment as part of an HTM file attachment in the migrated message.

NOTE: The maximum size limit for attachments is set in the Data Migration Wizard on the *Select Date and Size Filters* screen. You can modify the maximum attachment size on that screen but the size should not exceed the maximum attachment size allowed by Microsoft 365.

[Exchange] MigrateResourceDelegation=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.7

Determines whether the Data Migration Wizard, when it migrates resources, will migrate their designated owners and authorized managers, and Notes' *Owner Restrictions* settings. The Directory Export Wizard captures this information in any case, but its migration to Exchange is an option that is enabled or disabled by this boolean program parameter.

This feature is off by default (*MigrateResourceDelegation=0*). To migrate the identities of resource owners and managers, and the associated resource-management access behaviors, set *MigrateResourceDelegation=1*.

What Notes calls a resource owner corresponds closely to what Exchange calls a delegate, and Migrator for Notes to Exchange migrates Notes' resource owners and behaviors on that basis. A table in the Migrator for Notes to Exchange *Pre-Migration Planning Guide* (in chapter 3, see *Migrating Resources*) shows how Notes' *Owner Restrictions* are mapped to resource behaviors in Exchange.

Another Migrator for Notes to Exchange parameter (also in this [Exchange] section, see *GrantResourceOwnerFullAccess* above) lets you also optionally add resource-owner permissions to migrated resource delegates in Exchange.

[Exchange] MigrateRtfToHtml=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.1

Determines whether MNE converts Notes RTF (rich text format) to HTML format when migrating a Notes message body in RTF. MNE uses a Notes built-in API to convert RTF to HTML. The feature is off (0) by default. The following limitations apply:

- This feature is disabled if MNE is running in offline mode ([Notes] Offline=1) or the Notes User ID path or password is not set.

- The Domino HTML APIs only support Memo type for the Notes client.

- Some application, document, database, view, or folder links might be lost after converting to HTML.

- Only Domino/Notes version 8.5.3 or later is supported.

MNE will export Notes RTF to MS RTF if MNE fails to convert Notes RTF to HTML or the feature is disabled.

[Exchange] MigrateTopicAsCategory=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.0

Some special Notes Databases contain a Topic field which works the same as the Category field (Keywords attribute) in Exchange. Currently MNE will migrate the Topic as Subject in Exchange causing multiple messages to have the same Subject value but it is actually the Topic value.

By default (MigrateTopicAsCategory=0), MNE does not change the logic as the source does not contain a Topic field in most cases, If you set this parameter to 1, MNE migrates the Topic as Category, and does not migrate the Topic as Subject. Quest recommends you enable the parameter only when you encounter the issue in which the Topic field is incorrectly migrated as Subject for a special Database.

[Exchange] NoServer=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Do not connect to an Exchange server** check box in the *Select Destination Exchange Server* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] OversizedAttachmentsTargetFolderPath=<folderPath>

Type:	Default:	Occurs in:	New in:
string	Email_Attachments	Data Migr	4.16.1

Specifies the folder path relative to the mailbox user's OneDrive store root to which oversized attachments will be uploaded. The folder name can be separated with / or \ but cannot contain any of the special characters, such as ~ " # % & * : < > ? / \ { | } that are not allowed by OneDrive.

If the specified folder path is found to be invalid when the wizard is uploading oversized files, an error is logged and the default folder is used as the target folder instead. By default, the wizard uses Email_Attachments as the folder path for oversized attachments.

[Exchange] O365AccountSkuId=<YOUR_TENANT_NAME:SKU_PART_NUMBER>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.7

Specifies a single Microsoft 365 account SKU that the Data Migration Wizard should use when licensing end users for Microsoft 365. You can run the *Get-MsolAccountSku* cmdlet to retrieve the AccountSkuIds for all valid licenses.

The value of this setting is derived from the **Product License** field on the *Select Microsoft 365 Administrative Operations Quest* screen in the Data Migration wizard. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] O365DirsyncPreserveADAttrMail=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Prov	4.8

Determines whether the Provisioning Wizard should preserve or overwrite the AD mail attribute (if any) when merging a CMN-created contact with an AD principal whose mail attribute is not empty.

For example: `O365DirsyncPreserveADAttrMail=1` tells the wizard to preserve any existing AD mail attribute. By default (0), the attribute is overwritten.

[Exchange] O365DisabledServicePlans=<string>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	

A coma separated list of license plan services that have been disabled.

The value of this setting is derived from the **Product License** field on the **Select Microsoft 365 Administrative Operations Quest** screen in the Data Migration wizard. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] O365Environment=<ValidKeyword>

Type:	Default:	Occurs in:	New in:
keyword	AzureCloud	Data Migr	4.15.1

Identifies the Microsoft 365 environment that is the target of the migration. By default MNE will migrate to the O365 Global Cloud, but this parameter can be used to select one of the available Microsoft National Clouds (e.g. Microsoft 365 Germany). Currently the following values are supported for this parameter:

- AzureCloud

- AzureChinaCloud

- AzureGermanyCloud

> **i** | **NOTE:** This parameter is associated with the Microsoft 365 Environment UI element on the Migration Console's Exchange Server page. It is not recommended that you edit this parameter value directly, as there are several parameters that need to be updated to properly support Microsoft National Clouds.

[Exchange] O365MaxMailboxConnectionWaitTime=<#>

Type:	Default:	Occurs in:	New in:
integer	60 (minutes)	Data Migr	4.16.0

Replaces the obsolete [PowerShell] PropagationDelay parameter. It specifies the maximum number of time (in minutes) to keep retrying mailbox logons when the logon fails with an Access Denied error.

When migrating to Microsoft 365, MNE checks at the beginning of the migration to ensure that the migration account has Full Access rights on the target mailbox. If the account does not have rights, MNE uses PowerShell to grant access. It is common for there to be a delay between granting these permissions and the logon to the target mailbox succeeding. Occasionally, this delay can be significant, taking many minutes for the permission change to take effect.

When MNE logs onto an Microsoft 365 mailbox, if the logon fails with a permission denied error, MNE automatically retries the logon after 30 seconds. It keeps retrying the logon every 30 seconds until the logon succeeds or the O365MaxMailboxConnectionWaitTime has been exceeded.

[Exchange] O365Organization=<Custom_Azure_Org_Name>

Type:	Default:	Occurs in:	New in:
string	Your Azure organization name	Microsoft 365	4.16.1

When the MNE PowerShell module initializes OneDrive, the module assumes that your SharePoint administration URL is 'https://Your_O365_Azure_Organization_Name-admin.sharepoint.com'.

This parameter allows you to replace the default Azure organization name in the SharePoint admin URL with a different name. So if your SharePoint administration URL is 'https://NewOrg-admin.sharepoint.com' you would enter [Exchange] O365Organization=*NewOrg*.

[Exchange] O365PSConnectionUri=<URL>

Type:	Default:	Occurs in:	New in:
string	https://ps.outlook.com/powershell	Data Migr	4.15.1

Identifies the URL of the Microsoft 365 tenant's remote PowerShell endpoint. This setting is updated by the Migration Console when the **Apply** button is clicked on the Exchange Server page. The URL associated with the selected Microsoft 365 Environment is selected from the list of URLs in the **[MsOnlinePSConnectionUris]** section.

[Exchange] O365Tenant=<Office365_Tenant_Full_Name>

Type:	Default:	Occurs in:	New in:
string	<none>	Data Migr	4.15.1

Identifies the Microsoft 365 tenant name (e.g. MyTenant.onmicrosoft.com) when registering the App with the Microsoft Azure portal. This setting is updated by the Migration Console when the Apply button is clicked on the Exchange Server page after the user has performed an App Registration and successfully registered Migrator for Notes to Exchange with the Microsoft Azure portal.

[Exchange] O365UsageLocation=<xx>

Type:	Default:	Occurs in:	New in:
keyword	[none]	Data Migr	4.7

Specifies the Usage Location required by Microsoft for Microsoft 365 licenses, per this Microsoft article. The Usage Location is a two-letter code for the country, as described in *ISO 3166-1-alpha-2*. Migrator for Notes to Exchange's Admin Account Pooling Utility requires a value for this parameter, and the value must conform to the standardized values listed for *ISO 3166-1-alpha-2*.

[Exchange] PstFileName=<filename>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Specifies a common output PST filename for all migrating users, when migrating data to PSTs. This value is used in conjunction with the *PSTDir* column in the SQL Server database, which specifies a unique PST directory for each user. The combination of a common *PstFileName* value with unique *PSTDir* values assures that the newly created PST files will be identifiable by user.

For example: *PstFileName=migr-archive.pst* combined with *PSTDir* column values set to *server\home\user1, user2, user3*, etc., would produce these new PST files in these locations:

    \\server\home\user1\migr-archive.pst
    \\server\home\user2\migr-archive.pst
    \\server\home\user3\migr-archive.pst
    ... [etc.]

Otherwise, if the PSTDir column is unspecified and the PstFileName parameter sets the output filename to a common value, the multiple files saved to the same directory would be differentiated only by appended digits: migr archive 1.pst, migr archive 2.pst, migr archive 3.pst, and so forth. Each user in a collection should therefore have a unique directory specified in the PSTDir column, such as the user's home directory on a server.

If PSTDir columns are specified but the PstFileName setting is left unspecified, the [Outlook] PstFileNameFormat parameter is used to determine the PST filenames. If the PstFileNameFormat parameter is using the default setting (1), the new PST filenames are derived from users' display names.

[Exchange] PurgePABS=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

    Purge PABS=1

... tells the program to clear the contents of Personal Address Books in Exchange before migrating corresponding PABs from Notes—useful if, for example, you had already migrated PABs, but wanted to migrate them again. The default *PurgePABS=0* disables the feature, so no PABs are cleared. This feature clears only Exchange PABs that correspond to Notes PABs about to be migrated, and will not clear any other existing Exchange PABs.

[Exchange] RemigrateMode=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1 or 2)	1	Data Migr	3.2

Tells the Data Migration Wizard which of three methods to use, to avoid creating duplicate items in Exchange when an item that has already been migrated to Exchange is queued to migrate again. For example:

RemigrateMode=0

... tells the wizard to delete the Exchange copy of the item and remigrate it from Notes.

The parameter value is a single-digit integer, which must be one of these three valid values:

0: Delete the Exchange copy of the item and remigrate it from Notes.

1 (default): the source item in Notes is migrated, leaving the previously migrated copy not updated in Exchange.

If an encrypted message was migrated to the target as a placeholder, then you remigrate the message with MigrateEncryptedMessage=1, and the admin account running the wizard has the necessary credentials to decrypt the encrypted message, MNE will delete the Exchange copy (placeholder) and remigrate it from Notes regardless of the RemigrateMode setting.

2: If the source item in Notes was modified after a previous migration, delete the Exchange copy of the item and remigrate it from Notes. If the source item in Notes has not been modified, leave the previously migrated copy in Exchange.

The RemigrateMode parameter also impacts how folder permissions are migrated when a mailbox is migrated again. The following rules apply to the migration of folder permissions regardless of the RemigrateMode parameter setting and how many times the migration has been performed:

- Users who are listed in the Notes mail file ACL and are not already listed in the Exchange folder ACL list are added to the Exchange folders ACL list.

- Users who are listed in the Exchange folder ACL list and who are not listed in the Notes mail file ACL at all are not affected during the migration (i.e. their permissions are not revoked).

The RemigrateMode parameter affects the migration of folder permissions in scenarios where a user exists in both the Notes mail file ACL AND the Exchange Folder ACL. The `RemigrateMode` setting values affect the migration as described below:

0: Permissions for matching users are replaced. For example, if User X has Read/Write permissions in Exchange and Read permissions in Notes, the permissions for User X are updated from Read/Write to Read during the migration.

1 or 2: Permissions for matching users are not modified. For example, if User X has Read/Write permissions in Exchange and Read permissions in Notes, the permissions for UserX are not updated during the migration. The permissions remain as Read/Write.

[Exchange] RemoteMailboxRoutingAddressDomain=<DomainName>

Type:	Default:	Occurs in:	New in:
string	[null]	Data Migr	4.7

When migrating to Microsoft 365 and provisioning from a local AD using the Microsoft AD sync, this parameter sets the "right side" of each user's remote routing address on the remote mailbox (the portion of the address that follows the "@" symbol) to the value specified here. The left side of the address (preceding the "@" symbol) is the user Alias.

For example, if:

RemoteMailboxRoutingAddressDomain=example.sitraka.com

... the routing addresses **(targetAddress)** would be <Alias>@example.sitraka.com.

Note that this feature can be enabled only if remote mailbox-enabling is also enabled for this scenario by the DirSyncEnableRemoteMailbox parameter (also in this [Exchange] section, described in a previous entry).

[Exchange] RequireSenderAuthentication=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.14.1

Controls an Active Directory setting for provisioned groups. When set to the default value 1, the Exchange distribution group can accept messages from authenticated (internal) senders. Messages from unauthenticated (external) senders are rejected. When set to 0, all messages for the Exchange distribution group are accepted.

[Exchange] ResetO365Passwords=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

Corresponds to a GUI element in the Data Migration Wizard, the Reset Microsoft 365 Passwords check box on the wizard's *Operations* screen. The check box and parameter value determine whether, when mailbox-enabling users in Microsoft 365, the wizard will automatically generate random Microsoft 365 passwords, assign them to users' Microsoft 365 accounts, and save them locally so they can later be sent to users within Migrator for Notes to Exchange's You've Been Migrated mail-merge email. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RewriteRTF=<#>

Type:	Default:	Occurs in:
integer	0	Data Migr

A single digit, 0–7, that specifies which (if any) of migrating mail, appointment and task items the wizard should pass through Microsoft's rich-text converter—which in many cases will refine the exported compound document format from Notes' own converter. The parameter value must be one of these digits:

0: None	4: Tasks Only
1: Mail Only	5: Mail + Tasks
2: Appts Only	6: Appts + Tasks
3: Mail + Appts	7: Mail + Appts + Tasks

[Exchange] RootFolderAclMode=<#>

Type:	Default:	Occurs in:	New in:
integer	3	Data Migr	4.16.0

When migrating mailbox content, MNE also migrates mail file permissions to the folders within the target mailbox. The permissions are migrated to provide equivalent access in Exchange depending on the type of data contained within the folder. For example, mail folders are assigned permissions equivalent to the access granted to mail data in the source mail file.

Outlook provides a mechanism for opening up folders within other user's mailboxes. This mechanism only requires access to be granted on the specific folder being opened. For example, to view another mailbox's Inbox, a user only requires access to the Inbox within that mailbox. However, this mechanism is limited to specific well-known folders, such as the Inbox, Calendar, etc.

To browse other custom folders within another user's mailbox, you must add the target mailbox to the Outlook Profile. Browsing the folders in this manner only works if permissions are granted on the mailbox's root folder. Since the root folder does not contain any specific content, it is difficult to determine exactly what level of permissions to grant users on the root folder. There are pros and cons to each approach. This setting can be used

to select the approach that is appropriate for each customer's needs. The following values are supported for this parameter.

- **None (0):** Don't migrate any permissions to the Root folder. Users can only open specific well-known folders in mailboxes to which they have access using the Outlook Open User's Folder feature.

- **Set Folder Visibility Only (1):** Users who have access to any kind of content within the Notes mail file are granted Folder Visibility rights on the root folder in the target mailbox. This allows users to browse the folder structure of the root folder. However, the users can only access the content of the child folders to which they've been granted access. The downside of this approach is that any folders that are created directly under the root folder after the migration inherit the permissions of the root folder. This could lead to some users having limited access to some of the content within the mailbox. For example, a user who should have access to email content would be able to access the mail folders that were created during migration, but would not have access to the content of mail folders that were created after the migration. Conversely, users that have access to calendar/task/contact data only in the source mail file can view the folder structure of these newly created mail folders. However, they cannot view the content of these new mail folders.

- **Mail Folder Permission Only (2):** MNE configures the permission on the root folder to match all other mail folders (such as the Inbox). The advantage of this approach is that users who have access to email have all the access that they need in the target mailbox on folders that are created during the migration and also on folders that are created directly under the root folder after the migration (since those folders inherit their permissions from the root folder). The one disadvantage is that users who only have access to calendar/task/contact data can only access that data using Outlook's Open User's Folder feature. They cannot browse the mailbox content from the root folder.

- **Combined Permissions (3):** MNE combines the behavior of the previous two settings. Users who have access to mail content are granted equivalent access to the root folder. Users who have access to calendar/task/contact data are granted Folder Visibility permissions on the root folder. There are numerous benefits to this approach. All users who have access to any kind of content can browse the folders of the target mailbox from the root of the mailbox. Users with access to mail content are assured to have access to folders created during the migration and those that are created directly under the root folder after the migration. The one minor downside of this approach is that because folders that are created directly under the root folder after the migration inherit the permission of the root folder, users who have access to calendar/task/contact data are only granted Folder Visibility permissions on those folders. This does not grant these users access to the content within these folders. However, they can view the folder structure under these folders, granting them slightly more access than intended.

[Exchange] RPCAdminMapiProfile="<ProfileName>" **Deprecated**

Type:	Default:	Occurs in:	New in:
string	0	Data Migr	4.4.1

The name of an existing Outlook profile on the Migrator for Notes to Exchange admin migration computer that the Data Migration Wizard should use to access Microsoft 365 (when migrating to Microsoft 365). Use this setting, paired with the *RPCUseAdminMapiProfile* parameter (also documented separately below), when migrating to Microsoft 365:

```
[Exchange]
RPCUseAdminMapiProfile=1
RPCAdminMapiProfile="Outlook Profile"
```

The quotation marks enclosing the profile name may be omitted if there is no space in the profile name. The wizard will not read this parameter if the *RPCUseAdminMapiProfile* parameter is omitted or set to 0.

> **i** | **IMPORTANT:** This parameter has been deprecated and replaced with the `[Exchange] MapiAdminProfile` parameter. If this parameter is specified, it will continue to work, but a warning will be logged to the migration log file.
>
> Support for this parameter will be removed in a future version of MNE.

[Exchange] RPCProxyServerCertificationURL=<ServerURL>

Type:	Default:	Occurs in:	New in:
string	[none]	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the Principal name for proxy server text box) in the Exchange Proxy Settings dialog box in either the Notes Migration Manager or Data Migration Manager. The value specifies the Exchange proxy server certification server name (URL), when using the RPC protocol to communicate with the Exchange server. For example:

        RPCProxyServerCertificationURL=ExampleURL

This parameter is required if *RPCUseHTTP* (see that parameter for more information about the RPC protocol). The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCProxyServerURL=<ServerURL>

Type:	Default:	Occurs in:	New in:
string	[none]	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the Use this URL to connect to my proxy server check box) in the Exchange Proxy Settings dialog box in either the Notes Migration Manager or Data Migration Manager. The value specifies the proxy server name (URL), when using the RPC protocol to communicate with the Exchange server. For example: RPCProxyServerURL=ExampleURL

This parameter is required if *RPCUseHTTP=1*. See the *RPCUseHTTP* parameter for more information about the RPC protocol. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCUseAdminMapiProfile =<#> **Deprecated**

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.4.1

Tells the wizard whether it should use an existing Outlook profile on the Migrator for Notes to Exchange admin migration computer, rather than automatically generate a temporary profile to use for the migration. When migrating to Microsoft 365, you should set this parameter to 1, and specify a profile name with the *RPCAdminMapiProfile* parameter (also documented separately above):

        [Exchange]
        RPCUseAdminMapiProfile=1
        RPCAdminMapiProfile="Outlook Profile"

The wizard will not read the *RPCAdminMapiProfile* parameter if this *RPCUseAdminMapiProfile* parameter is omitted or set to 0.

> ℹ️ **IMPORTANT:** This parameter has been deprecated. If this parameter is specified, it will continue to work when used with the `RPCAdminMapiProfile` parameter (also deprecated), but a warning will be logged to the migration log file.
>
> Support for this parameter will be removed in a future version of MNE.

[Exchange] RPCUseAuthType=<#>

Type:	Default:	Occurs in:	New in:
keyword	1	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the Use this authentication… drop-down list box) in the *Exchange Proxy Settings* dialog box in either the Notes Migration Manager or Data Migration Manager. The value specifies the authentication method the Data Migration Wizard should use when connecting to the Exchange proxy server, when using the RPC protocol to communicate with the Exchange server. For example:

        RPCUseAuthType=2

... tells the wizard to use the NTLM method, while the default *RPCUseAuthType=1* specifies the basic authentication method. See the *RPCUseHTTP* parameter for more information about the RPC protocol. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCUseFastHTTP=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the **On fast networks…** check box) in the *Exchange Proxy Settings* dialog box in either the Notes Migration Manager or Data Migration Manager. The value determines whether the Data Migration Wizard will, when using the RPC protocol to communicate with the Exchange server on a fast network, connect using HTTP first, and connect using TCP/IP. For example:

        RPCUseFastHTTP=1

... tells the wizard to enable this option, while the default (0) disables the option. See the *RPCUseHTTP* parameter for more information about the RPC protocol. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCUseHTTP=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element, the Connect using Outlook Anywhere check box, in the Notes Migration Manager (*Exchange Server Configuration* screen) and Data Migration Manager (*Select Destination Exchange Server* screen). The boolean value determines whether the Data Migration Wizard will use Remote Procedure Calls (RPC) within HTTP packets to communicate with the target Exchange Server. For example:

        RPCUseHTTP=1

... tells the wizard to use this RPC protocol, while the default (0) tells the wizard to use the default TCP protocol. The RPC protocol is required when migrating to Microsoft 365, and is optional but may improve data throughput when migrating to an proprietary Exchange in a slower network. Note that the target Exchange server must also be configured for the RPC protocol to use it, by the other RPC… parameters in this [Exchange] section. (These other parameters are set by GUI elements in the Exchange Proxy Settings dialog box.)

The program writes this value to the Task Parameters from an admin's GUI entry in either screen; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCUseProxyCertification=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the **Mutually authenticate the session when connecting with SSL** check box) in the *Exchange Proxy Settings* dialog box in either the Notes Migration Manager or Data Migration Manager. The value determines whether the Data Migration Wizard will mutually authenticate the session when using the RPC protocol to communicate with the Exchange server. For example:

> RPCUseProxyCertification=1

... tells the wizard to enable this option, while the default (0) disables the option. See the *RPCUseHTTP* parameter for more information about the RPC protocol. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCUseSlowHTTP=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the **On slow networks…** check box) in the *Exchange Proxy Settings* dialog box in either the Notes Migration Manager or Data Migration Manager. The value determines whether the Data Migration Wizard will, when using the RPC protocol to communicate with the Exchange server on a slow network, connect using HTTP first, and connect using TCP/IP. For example:

> RPCUseSlowHTTP=1

... tells the wizard to enable this option, while the default (0) disables the option. See the *RPCUseHTTP* parameter for more information about the RPC protocol. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] RPCUseSSL=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	NMM, Data Migr	4.1.4

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

This parameter corresponds to a GUI element (the **Connect using SSL only** check box) in the *Exchange Proxy Settings* dialog box in the Notes Migration Manager or Data Migration Manager. The value determines whether the Data Migration Wizard will use a secure socket layer (SSL) to connect to the Exchange proxy server, when using the RPC protocol to communicate with Exchange. For example:

> RPCUseSSL=0

... tells the wizard to not use SSL, while the default (1) tells the wizard to use SSL. This parameter can be set to 0 only if the authentication method is set to NTLM by *RPCUseAuthType=2* (see the *RPCUseAuthType* parameter above). See the *RPCUseHTTP* parameter for more information about the RPC protocol. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] Server=<ServerSpecification>

Type:	Default:	Occurs in:
string	[none]	NMM, Data Migr

This value corresponds to a GUI element in the Notes Migration Manager: the mailbox Exchange Server for Mail Profile text box in the Exchange Server Configuration screen. The role of this configuration item is currently obsolete and is only used as a backup attribute for the Mailbox Server or Exchange CAS for Remote PowerShell, purely for backward compatibility purposes.

The feature is enabled/disabled, and the server name is set, by:

Server=<ServerName>

The value is written to the Task Parameters from an admin's GUI entry. As this value is set via a GUI element, Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Exchange] ServerMailResolveAttendees=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

This setting applies to data being migrated to a server mailbox (either primary or archive). It tells the Data Migration Wizard to do an Exchange GAL lookup of attendees of migrated items to retrieve their Exchange addresses. Successfully resolved attendees are migrated to the target using their Exchange addresses instead of their SMTP addresses. This is required for free-busy lookups to succeed.

This feature can be disabled by setting the parameter to 0.

[Exchange] SetResourceMeetingSubjectToOrganizerName=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.12

Determines whether the *Subject* field for migrated meetings in resource calendars will be set to the *Subject* of the meeting, or to the organizer of the meeting (the person who booked the resource). By default (*SetResourceMeetingSubjectToOrganizerName=0*) the *Subject* field for migrated meetings in a resource's calendar is set to the *Subject* of the meeting, as in prior Migrator for Notes to Exchange releases. But setting the *Subject* field to the *Subject* of the meeting (by *SetResourceMeetingSubjectToOrganizerName=1*) mimics native Exchange/Outlook behavior.

[Exchange] SetManagedByToUserForest=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	AD Grps	4.1.5

Determines whether the wizard will set the *managedBy* attribute to the DN of the owner in the user forest (1) or of the owner in the resource forest (0)—for environments configured for a resource and user forest. For example: *SetManagedByToUserForest=1* tells the wizard to set *managedBy* to the DN of the owner in the user forest. The default (*SetManagedByToUserForest=0*) sets the *managedBy* attribute to the DN of the owner in the resource forest.

> **i** | **NOTE:** Setting the *managedBy* attribute to the DN of the owner in the user forest requires a two-way trust between the two domains, which must be established before the wizard is run. The user/resource forest environment is intended to be a one-way trust, however, so that must be restored after the wizard has run. If the two-way trust is not established prior to running the wizard, the *managedBy* attribute will not be set correctly and the wizard will generate this error:
> ERROR: [8810-117-28-8007202F] Unable to add group ACL to ….

[Exchange] SetResourceToAutoAccept=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Prov	4.6

Determines whether the Provisioning Wizard will enable the Exchange autoaccept feature upon provisioning of resources. The default *SetResourceToAutoAccept=1* enables the feature. The alternative (0) leaves the feature disabled.

[Exchange] SupportOversizedAttachmentsInLegacyOutlook=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.1

Tells the Data Migration Wizard whether to migrate an oversized message attachment using a method that modern Outlook (Outlook 2016 or later) or an OWA client can render correctly or to revert to an attachment type that legacy Outlook 2013 or earlier can render.

The default value 0 migrates attachments for modern Outlook and value 1 migrates attachments in the way that legacy Outlook supports.

[Exchange] TargetAddressDomain=<DomainName>

Type:	Default:	Occurs in:
string	[null]	Prov

When provisioning users into local AD, and *ProvisionUsers=1*, this parameter tells the Provisioning Wizard to replace each user's mail domain with the specified parameter value. For example:

TargetAddressDomain=boofah.com

... tells the wizard that a user whose target address would otherwise be *UserXYZ@sitraka.com* should instead be provisioned into AD as *UserXYZ@boofah.com*. The default value is null (no substitution occurs).

[Exchange] TargetType=<#>

Type:	Default:	Occurs in:	New in:	Updated in:
integer	[GUI entry]	NMM, Data Migr	4.1	4.5

This value corresponds to a GUI element in the Notes Migration Manager: the **Target Exchange server version** field in the *Exchange Server Configuration* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value specifies the migration destination, by one of these valid numeric keywords:

- 2010 – For Exchange 2010
- 2013 – For Exchange 2013
- 2016 – For Exchange 2016
- 2019 – For Exchange 2019
- 36515 – For Microsoft 365 without Azure Active Directory Synchronization
- 365151 – For Microsoft 365 with Azure Active Directory Synchronization

[Exchange] TargetTypeTested=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1, 2 or 3)	1	Data Migr	4.1

An auto-set parameter (see GUI-set and other "auto-set" parameters) that notes whether the Data Migration Wizard has detected CDOEXM, or PowerShell, or both, or neither, on the target (destination) Exchange server. The parameter value is a single-digit keyword representing one of four possible cases:

TargetTypeTested=0	: No CDOEXM or PowerShell was found.
TargetTypeTested=1	: CDOEXM was found.
TargetTypeTested=2	: PowerShell was found.
TargetTypeTested=3	: Both CDOEXM and PowerShell were found.

[Exchange] TestMailboxAccess=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.1

By default, MNE adds the test message "Quest access test message" to the Trash folder of the user target mailbox during migration to test the mailbox access.

To skip testing mailbox access and stop the test message being added to the target mailbox at migration, specify [Exchange] TestMailboxAccess=0.

[Exchange] TestMailboxMapiConnectivity=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.1

When you are migrating user collections that have a large number of users that are already validated, you can use this parameter to skip the time-consuming validation of each mailbox and to proceed immediately with the migration.

To skip the MAPI Http Connectivity test for each mailbox in the user collection during the 'Verifying Exchange Account' step of the migration wizard, specify [Exchange] TestMailboxMapiConnectivity=0.

[Exchange] UpdateAddressList=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1

> UpdateAddressList=1

… tells the Data Migration Wizard to run the *Update-AddressList* cmdlet after mailbox-enabling a collection, to complete the AD provisioning of recipients who are only partially provisioned. The *Update-AddressList* cmdlet will run with its identity parameter set to "All Users" by default, or to some other identity value if set by the `AddressListName` parameter (also in this [Exchange] section). This parameter can be useful in migrations to Exchange 2010, when objects have been provisioned by tools such as Microsoft Identity Integration Server (MIIS) or custom provisioning tools that do not fully provision recipient objects. By default (0), the cmdlet will not run.

[Exchange] UpdateEmailAddressPolicy=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1

> UpdateEmailAddressPolicy=1

… tells the wizard to run the *Update-EmailAddressPolicy* cmdlet after mailbox-enabling a collection, to complete the AD provisioning of recipients who are only partially provisioned. The *Update-EmailAddressPolicy* cmdlet will run with its identity parameter set to *Default Policy* by default, or to some other identity value if set by the *AddressPolicyName* parameter (also in this [Exchange] section). This can be useful in migrations to Exchange 2010, when objects have been provisioned by tools such as Microsoft Identity Integration Server (MIIS) or custom provisioning tools that do not fully provision recipient objects. By default (0), the cmdlet will not run.

[Exchange] UpdateHtmlWithMismatchedCharset=<charset>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.15.1

When migrating to on-premises Exchange or Microsoft 365 targets, MIME encoded HTML emails may not display correctly in the email client if there is a mismatch between the character encoding declared in the HEAD element of the HTML message and the character encoding declared in the MIME headers. When a mismatch occurs, the message displays as garbled text.

To correct this issue, enable the parameter by specifying the character set used by the HTML HEAD element that is causing a problem. For example:

```
UpdateHtmlWithMismatchedCharset=UTF-16
```

When the parameter is enabled, MNE checks for the character set in the HTML HEAD element and when found, the character set is replaced with the MIME header character set.

The parameter is disabled by default. Only enable the parameter if corrupted characters are observed in migrated messages.

> **i** | **NOTE:** If errors occur during the parsing of the HTML, NME migrates the message with no modification.

Example 1

```
UpdateHtmlWithMismatchedCharset=UTF-16
```

	MIME charset	**HEAD charset**
message 1	UTF-8	UTF-16 changed to UTF-8
message 2	UTF-8	US-ASCII (unchanged)

Example 2

```
UpdateHtmlWithMismatchedCharset=US-ASCII
```

	MIME charset	**HEAD charset**
message 1	UTF-8	UTF-16 (unchanged)
message 2	UTF-8	US-ASCII changed to UTF-8

[Exchange] UpdateHtmlWithMissingCharset=<#>

Type:	Default:	Occurs in:	New in:
boolean	[none]	Data Migr	4.13

MIME encoded HTML emails often have the charset encoding declared in two places. The first is within the MIME headers and the second is within the HEAD element of the HTML message itself. With properly formatted emails, these two charset declarations are identical. Some HTML emails have been found where the charset declaration in the MIME headers and the charset declaration in the HTML message do not match. Typically in these cases, the HTML charset declaration is not in the HEAD element where it is expected, but instead it appears later in the document, possibly in the BODY element. While these emails may not be technically valid, they are still handled properly by most email clients.

A new behavior has been observed in Microsoft 365 where the Exchange server attempts to correct the discrepancy in the charset declarations by removing the HTML charset declaration that conflicts with the MIME

header charset declaration, and inserting a new HTML charset declaration in the HEAD element that matches the charset of the MIME header. In these cases the charset declaration will no longer match the encoding of the HTML body and as a result, non-ASCII characters are corrupted in the rendering of the email message.

To correct this issue, enable the `UpdateHtmlWithMissingCharset` option. With this option enabled, MNE checks for the presence of a charset declaration in the HTML HEAD element during the migration process. If missing, NME inserts a charset declaration using the charset value from the MIME message header. While this charset declaration may not match the encoding of the message, it makes Microsoft 365 think that everything is proper, and prevents Microsoft 365 from removing the correct charset declaration that appears later in the document. The second charset declaration in the body overrides the newly inserted one that is declared in the HEAD element. As a result, the email message renders properly in the email client.

If any parsing errors occur during the parsing of the HTML, NME migrates the message with no modifications.

This option is off by default. This option adds some minimal overhead to the migration process. It should only be enabled if corrupted characters are observed in the migrated messages.

The issue has only been observed when migrating to Microsoft 365, but it could potentially be introduced in a later update to on-premises Exchange.

[Exchange] UseAdminAcctPool=<#>

Type:	Default:	Occurs in:	New in:
boolean	• On premises: N/A • Microsoft 365: 0	Grp Prov, Data Migr	4.15.1

Enables the Migrator for Notes to Exchange's Admin Account Pool features (see the chapter "Microsoft 365 Admin Account Pool utility" in the *Migrator for Notes to Exchange Administration Guide*).

> **i** | **NOTE:** This parameter corresponds to the Exchange Settings check box **Use admin account pool**.

[Exchange] UseAutodiscoverCreateProfile=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.15.1

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 81.

Specifies whether or not the Exchange Autodiscover service will be used to configure the MAPI profile created to connect to Exchange. When UseAutodiscoverCreateProfile is set to `0`, the following parameters are used to manually configure the MAPI profile settings:

- `[Exchange] RPCProxyServerCertificationURL`
- `[Exchange] RPCProxyServerURL`
- `[Exchange] RPCUseAuthType`
- `[Exchange] RPCUseFastHTTP`
- `[Exchange] RPCUseHTTP`
- `[Exchange] RPCUseProxyCertification`
- `[Exchange] RPCUseSlowHTTP`
- `[Exchange] RPCUseSSL`

When `UseAutodiscoverCreateProfile` is set to `1`, the parameters above are ignored and any MAPI profiles that are created by MNE are configured using Autodiscover. The parameters listed below can be used to customize the call to the Autodiscover service:

- `[Exchange] AllowSelfSignedCerts`
- `[Exchange] AutodiscoverDisableMapiHttp`

- `[Exchange] AutodiscoverMaxHops`

- `[Exchange] AutodiscoverEnableScpLookup`

Note the following:

- The `UseAutodiscoverCreateProfile` parameter is only configurable when migrating to an on-premises target with Outlook 2010 or 2013.

- Outlook 2016 and 2019 always uses the Autodiscover service when opening MAPI connections, Therefore, this parameter has no effect.

- When migrating to an Microsoft 365 target, this parameter is fixed at 1 to ensure that the profile is configured to use MAPI/HTTP protocol.

  i | **NOTE:** This parameter corresponds to the Exchange Settings check box **Automatically configure profile**.

[Exchange] UseMneMapiHttpLib=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.0

MNE no longer uses Outlook MAPI to write data to the target server mailbox. Quest has created its own library that implements Microsoft's MAPI/HTTP protocol. This library has many advantages over Outlook MAPI and it is now used in almost all migration scenarios that target server mailboxes.

There are limited scenarios where the MNE MAPI/HTTP library is not used:

- The migration target is Exchange 2010, which does not support the MAPI/HTTP protocol.

- The migration client is the SSDM and the client workstation does not have .NET runtime 4.5 (or later) installed.

Use this parameter to force MNE to revert back to using Outlook MAPI to perform the migration. Quest strongly recommends that customers not do this unless directed by Quest support personnel.

The parameter to use the MNE MAPI/HTTP library is enabled by default so parameters that use Outlook MAPI are not used during migration. The parameters that are only used by Outlook MAPI are as follows:

- `[Exchange] AutodiscoverDisableMapiHttp`

- `[Exchange] AutodiscoverPreferInternalRpcHttpUrl`

- `[Exchange] DisableCredentialScanner`

- `[Exchange] DisableDialogScanner`

- `[Exchange] MapiAdminProfile`

- `[Exchange] MAPIRetryCount`

- `[Exchange] MAPIUseSharedProfile`

- `[Exchange] MaxSessionReconnectCount`

- `[Exchange] MessageRetryCount`

- `[Exchange] RPCProxyServerCertificationURL`

- `[Exchange] RPCProxyServerURL`

- `[Exchange] RPCUseAuthType`

- `[Exchange] RPCUseFastHTTP`

- `[Exchange] RPCUseHTTP`

- `[Exchange] RPCUseProxyCertification`

- `[Exchange] RPCUseSlowHTTP`

- `[Exchange] RPCUseSSL`

- `[Exchange] UseAutodiscoverCreateProfile`

[Exchange] UseO365Domain=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	NMM, Dir Exp	4.6

Determines whether the MNE Directory Export Wizard and Notes Migration Manager will update target addresses for the Microsoft 365 domain (applies only when migrating to Microsoft 365). When migrating to Microsoft 365, the default *UseO365Domain=1* tells the Directory Export Wizard to update target addresses with the new Microsoft 365 domain. Also, if you change the target type to Microsoft 365 (in the MNE Notes Migration Manager) and apply that change, the default *UseO365Domain=1* tells Notes Migration Manager to regenerate the address translation table, to update target addresses with the new Microsoft 365 domain. To not update target addresses with the Microsoft 365 domain, disable this feature by setting *UseO365Domain=0*.

[Exchange] UsePstFileName=<#>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[Exchange] ViewEntireForest=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.12

Determines whether the scope of Migrator for Notes to Exchange's Data Migration Wizard will be expanded to the entire forest rather than limited to just the local domain. For example: ViewEntireForest=1 tells the wizard to expand its scope to include the entire forest. The feature is off (0) by default.

An expanded scope can be useful, for example, where Migrator for Notes to Exchange needs to run the *set adserversettings -viewentireforest $true* PowerShell cmdlet in a multi-domain forest, to enable other PowerShell commands for the same scope. (Note that the cmdlet must be run by Migrator for Notes to Exchange, not run independently.)

[Filter] section

[Filter] AttachSize=<####>

Type:	Default:	Occurs in:
integer	20971520 for O365 target; otherwise [none]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **KB** field in the *Select Date and Size Filters* screen, which specifies a size limit for attachments (only attachments that are smaller than the designated size will be migrated). The parameter value here is in bytes, although the value in the screen is entered in KB. (The default 20971520 bytes for an O365 target corresponds to a 20480 KB entry in the screen.) The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] FirstCalDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	[GUI entry]	Data Migr	4.5

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate only calendar data ... dated on or after** field in the *Select Date and Size Filters* screen, which specifies the earliest items that the program will migrate (items that are timestamped on or after the designated date). The wizard writes this value to the Task

Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] FirstDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	NONE	Data Migr	4.5

Specifies the earliest items that the program will migrate (items that are timestamped on or after the designated date). When set to NONE, all mail and calendar items are migrated.

Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] FirstMailDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	[GUI entry]	Data Migr	4.5

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate only messages ... dated on or after** field in the *Select Date and Size Filters* screen, which specifies the earliest items that the program will migrate (items that are timestamped on or after the designated date). The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] LastCalDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	[GUI entry]	Data Migr	4.5

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate only calendar data ... dated on or before** field in the *Select Date and Size Filters* screen, which specifies the latest items that the program will migrate (items that are timestamped on or before the designated date). The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] LastDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	NONE	Data Migr	4.5

Specifies the latest items that the program will migrate (items that are timestamped on or before the designated date). When set to NONE, all mail and calendar items are migrated.

Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] LastMailDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	[GUI entry]	Data Migr	4.5

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate only messages ... dated on or before** field in the *Select Date and Size Filters* screen, which specifies the latest items that the program will migrate (items that are timestamped on or before the designated date). The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filters] section

[Filters]
Filter<#>=<FolderName>
Filter<#>=<ViewName>

Type:	Default:	Occurs in:
string	none	Data Migr

Each line specifies a folder name. The specified folder is excluded from the migration. For example:

[Filters]

Filter0=Folder1

Filter1=Folder2

Folders can be included or excluded by setting `[Filters]`, `[FolderTreeFilters]`, and `[IncludeFoldersAndViews]`. The precedence order is `[Filters] > [IncludeFoldersAndViews] > [FolderTreeFilters]`.

- If a folder is named in both the `[Filters]` section and the `[IncludeFoldersAndViews]` section, the `[Filters]` section takes precedence and the folder or view is not migrated.

- If a folder is named in both the `[IncludeFoldersAndViews]` and the `[FolderTreeFilters]`, the `[IncludeFoldersAndViews]` sections take precedence and the folder or view is migrated. Since the `[FolderTreeFilters]` section impacts the sub folders, the sub folders are still excluded if they are not named in the `[IncludeFoldersAndViews]`.

[FolderTreeFilters] section

[FolderTreeFilters] Filter<#>=<FolderName>

Type:	Default:	Occurs in:	New in:
string	none	Data Migr	4.15.2

Each line specifies a folder name. The specified folder and all sub folders are excluded from the migration. For example:

[FolderTreeFilters]

Filter0=Folder1\sub1

Filter1=Folder2\sub1

Folders can be included or excluded by setting `[Filters]`, `[FolderTreeFilters]`, and `[IncludeFoldersAndViews]`. The precedence order is `[Filters] > [IncludeFoldersAndViews] > [FolderTreeFilters]`.

- If a folder is named in both the `[Filters]` section and the `[IncludeFoldersAndViews]` section, the `[Filters]` section takes precedence and the folder or view is not migrated.

- If a folder is named in both the `[IncludeFoldersAndViews]` and the `[FolderTreeFilters]`, the `[IncludeFoldersAndViews]` sections take precedence and the folder or view is migrated. Since the `[FolderTreeFilters]` section impacts the sub folders, the sub folders are still excluded if they are not named in the `[IncludeFoldersAndViews]`.

[General] section

[General] ACLs=<#>

Type:	Default:	Occurs in:	Updated in:
boolean	1	Data Migr	4.10

    ACLs=0

... tells the wizard to not manipulate ACLs in any way during the migration. By default (*ACLs=1*) the wizard will copy ACL information and will set folder permissions in Exchange. *New in version 4.10:* The *ACLs* parameter now also determines whether PAB ACLs will be migrated. Prior to this enhancement, PAB ACLs were always migrated regardless of this *ACLs=<#>* setting.

[General] AllowForwardtoNotesConnector=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Tells the Data Migration Wizard whether to migrate Notes server-based AutoForwarding rules to comparable forwarding rules in Exchange, when the rules contain Notes-style addresses instead of SMTP addresses. For example: *AllowForwardtoNotesConnector=0* tells the wizard to not migrate rules with Notes-style addresses. This parameter is ignored if *MigForwarding=0* (see below).

[General] ArchiveDest=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	PST	Data Migr

Specifies the destination for migrated archives. Valid values are "PST" or "server".

If ArchiveDest=server, the ArchiveDestServerArchive parameter (documented separately) determines whether archives will be migrated to users' server-mail mailboxes or personal-archive mailboxes.

[General] ArchiveDestServerArchive=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.4.1

Determines whether archives will be migrated to users' server-mail mailboxes (0) or personal-archive mailboxes (1). For example:

    ArchiveDestServerArchive=1

… tells the wizard to migrate users' archives to their personal archive mailboxes. Note that this `ArchiveDestServerArchive` parameter is relevant only if `ArchiveDest=server` (as documented above). If `ArchiveDest=pst`, this `ArchiveDestServerArchive` parameter is ignored.

[General] AskArchiveDest=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Determines whether the *Select Destinations for Migrated Data* screen, in the Data Migration Wizard, will display (1) or hide (0) the **Archives** drop-down list box. By default (1), the item does appear in the screen, but *AskArchiveDest=0* tells the wizard to not show the **Archives** field in the screen.

[General] AskFilter=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

> AskFilter=0

... disables date filtering in the Data Migration Wizard, and tells the wizard to not present the date-filtering options to the user in the GUI. Date filtering lets an admin limit the items migrated by date: no earlier than, no later than, or both. By default this feature is enabled—that is, the date-filtering options do appear available to the user in the GUI.

[General] AskPABDest=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Determines whether the *Select Destinations for Migrated Data* screen, in the Data Migration Wizard, will display (1) or hide (0) the **Address books** drop-down list box. By default (1), the item does appear in the screen, but:

> AskPABDest=0

... tells the wizard to not show the **Address books** field in the screen.

[General] AskServerMailDest=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Determines whether the *Select Destinations for Migrated Data* screen, in the Data Migration Wizard, will display (1) or hide (0) the **Server-based data** drop-down list box. By default (1), the item does appear in the screen, but:

> AskServerMailDest=0

... tells the wizard to not show the **Server-based data** field in the screen.

[General] ATGenerated=<#>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters). The wizard notes whether a compiled *AddressTranslation.bin* file has ever been generated (1=yes, 0=no), and writes the value to this parameter.

[General] AttachmentFilteredbySizeMsg=<PathAndFilename>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2.0

Specifies the path and file name of the text file (*.txt) that contains a customized message that the Data Migration Wizard inserts in place of any attachment that the wizard removes due to a size limitation. The wizard lets you specify a size limit for attachments in migrating messages.The wizard removes any attachment that exceeds the limit and replaces it with an explanatory note in the message body. The wizard inserts a default explanatory note unless *UseFilteredAttachmentMsg=1* (see below), in which case the wizard inserts the customized message from the text file specified here. If *UseFilteredAttachmentMsg=0*, the wizard ignores this *AttachmentFilteredbySizeMsg* parameter.

For example:

> AttachmentFilteredbySizeMsg=c:\temp\custom_msg.txt

... tells the wizard to insert the contents of *c:\temp\custom_msg.txt* in place of the removed attachment whenever an attachment exceeds the size limit. This feature is also an option in the SSDM (same parameter, but in the *notesdtapp.ini* file).

[General] AttachmentLostDueToEncryptionMsg=<PathAndFilename>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2.0

Specifies the path and filename of the text file (*.txt) that contains a customized message that the Data Migration Wizard should insert in place of an attachment to a migrated encrypted message. When an encrypted message is migrated, the attachment is removed and replaced by an explanatory note. The wizard will insert a default explanatory note unless *UseFilteredAttachmentMsg=1* (see below), in which case the wizard will insert the customized message drawn from the text file specified here. If *UseFilteredAttachmentMsg=0*, the wizard will ignore this *AttachmentLostDueToEncryptionMsg* parameter. For example:

> AttachmentLostDueToEncryptionMsg=c:\temp\custom_msg.txt

... tells the wizard to insert the contents of *c:\temp\custom_msg.txt* in place of the removed attachment in each migrated encrypted message. This feature is also an option in the SSDM (same parameter, but in *notesdtapp.ini*).

[General] BodyLostDueToEncryptionMsg=<PathAndFilename>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2.0

Specifies the path and filename of the text file (*.txt) that contains a customized message that the Data Migration Wizard should insert in place of the encrypted body of a migrated encrypted message. When an encrypted message is migrated, the encrypted message text is removed from the message body, but is replaced by an explanatory note. The wizard will insert a default message unless *UseFilteredBodyMsg=1* (see below), in which case the wizard will insert the customized message drawn from the text file specified here. If *UseFilteredBodyMsg=0*, the wizard will ignore this *BodyLostDueToEncryptionMsg* parameter. For example:

> BodyLostDueToEncryptionMsg=c:\temp\custom_msg.txt

... tells the wizard to insert the contents of *c:\temp\custom_msg.txt* in place of the removed message body in each migrated encrypted message. This feature is also an option in the SSDM (same parameter, but in *notesdtapp.ini*).

[General] CentralLogDir=<UNCPathSpecification>

Type:	Default:	Occurs in:
string	[none]	NMM

This value corresponds to a GUI element in the Notes Migration Manager: the **Directory for central log and status files** text box (under **End-user tool settings**) in the *Shared Directories Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] CentralLogLevel=<#>

Type:	Default:	Occurs in:
keyword	1	NMM

This value corresponds to a GUI element in the Notes Migration Manager: the Log level radio buttons for End-user tool settings in the *Shared Directories Configuration* screen. The value specifies how much detail the program will include in its run logs. Valid values are single digits, $0 \leq x \leq 3$. The default value 1 is suitable for most routine production runs. If you need to diagnose a problem, set the value to 3 (verbose). The GUI offers two radio-button options that correspond to these numeric parameter values:

> 1 = Normal
> 3 = Verbose

The program writes this value to the Task Parameters from an administrator's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] ContactDisplayNameFormat=<#>

Type:	Default:	Occurs in:	New in
keyword (single digit 0, 1, 2, or 3)	1	Data Migr	4.14.1

Determines how contacts are displayed in Outlook. The options for this setting are:

- 0 – Use Legacy Naming – Contacts are named using the first value from the Notes Full Name field which does not start with "CN=". This is how contacts were named in all versions of Migrator for Notes to Exchange prior to version 4.14.1.179.

- 1 (Default) – Use the Notes contact's display name – Create the display name using the format specified by the contact's **View display name format** setting in Notes.

- 2 – Create the display name as **FirstName LastName**. The middle name and name suffix are included, if present.

- 3 – Create the display name as **LastName, FirstName**. The middle name is included, if present.

[General] ContactsName=<MigratedFolderName>

Type:	Default:	Occurs in:
string	Notes	Data Migr

Determines how users' primary Contacts folders are named. For example:

        ContactsName=MyContacts

... tells the wizard to name each user's primary Contacts folder "MyContacts."

[General] DeclineFolderCheck=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Determines whether the Data Migration Wizard will display its Check for Outlook Folders prompt if it cannot identify the necessary Outlook folder names during the wizard's test to verify valid access to servers. (The wizard tests server access by attempting to send a dummy message to the mailbox of the first user assigned to each server within the collection. If the wizard cannot identify the destination Outlook folder—for example, if the folder names have been localized to another language—this prompt asks the admin to correct the localized names in the configuration before continuing with the test.) By default (1) this prompt will appear as described above. If you disable the prompt by:

        DeclineFolderCheck=0

... the wizard will not display the prompt, and the migration will likely generate server-access errors.

[General] DeferredMailDate=<mm/dd/yyyy>

Type:	Default:	Occurs in:	New in:
date	now	Data Migr	4.16.0

Supports the Domino feature that allows you to schedule messages to be sent on a specific date and time. After migration, Exchange or Exchange Online will not send the deferred messages.

Specifies the earliest date that deferred emails (sent items that are timestamped on or after that date) will be written to a log file (named XXX-DeferredEmails.tsv) located in the MNE log folder. If the parameter is not set, only deferred messages that have a date after NOW are written to the log file. If you plan to shut down the Domino server on a specific day after the migration, it is recommended that you set the parameter to be on or before that day. This provides you with a list of deferred emails that were not delivered by Domino.

[General]DetailedMigrationUserStatsUpdateInterval=<#>

Type:	Default:	Occurs in:	New in:
boolean	15	Data Migr	4.15.2

Tells the Data Migration process to update user statistics after an interval of 15 seconds (default). The minimum supported interval value is 5 seconds.

The User Migration Status window displays real-time user statistics. Open the window from the Task Progress and Task Completed pages of the Data Migration Wizard by clicking **User Status**.

[General] DisableDebugPool=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	All logging applications and Log Viewer	4.15.2

Specifies if the program caches and writes out 128 DEBUG log lines before a WARNING or ERROR when LogLevel is less than or equal to 2. When LogLevel equals 3, the debug log is always written out.

When set to the default value (0), the debug pool is enabled and the program caches up to 128 DEBUG log lines. The program writes out the previous 128 DEBUG log lines when it meets a WARNING or ERROR.

Set `DisableDebugPool=1` if you don't want the previous DEBUG log to be written out before a WARNING or ERROR when LogLevel is less than or equal to 2.

[General] DoMailRouting=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Manage mail routing check box in the *Operations* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] DoSourceAdmin=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Notes administrative functions check box in the *Operations* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] DoTargetAction=<#>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[General] EndUserDir=<PathSpecification>

Type:	Default:	Occurs in:
string	[none]	NMM

This value corresponds to a GUI element in the Notes Migration Manager: the **Common application directory** text box (under *Common tool settings*) in the *Shared Directories Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] EndUserStatsDir=<UNCPathSpecification>

Type:	Default:	Occurs in:
string	[none]	NMM, Usr Stats

This value corresponds to a GUI element in the Notes Migration Manager: the End-User statistics directory text box in the *Gather End-User Statistics* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] FileAsFormat=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	*Same*	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Set contact 'File as' to drop-down listbox in the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The FileAsFormat parameter determines the format of the contact's **File As** attribute in Exchange. The **File As** attribute is used by Outlook to alphabetize your contacts. The options for this setting are:

- **Same:** Use the Display Name attribute of the address book entry. By default Migrator for Notes to Exchange migrates contacts using display names that match the display name of the contact in Notes, however the contact's display format can be modified using the `[General] ContactDisplayNameFormat` parameter.

- **FirstLast:** Create the **File As** using the first name and last name attributes separated by a space. The middle name and name suffix are included, if present.

- **LastFirst:** Create the **File As** using the last name and first name attributes separated by a comma. The middle name is included, if present.

[General] ForwardingMethod=<x>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1, or 2)	[varies; see below]	Data Migr	4.5

Determines which method the wizard will use for Active Directory mail forwarding. The parameter value is a single-digit integer, which must be one of these three valid values:

0: Forward by creating a hidden contact and attaching it as the alternate recipient of the mailbox.

1 (default when migrating to Hosted Exchange): Forward by setting the *targetAddress* attribute.

2 (default and mandatory when migrating to Microsoft 365 with or without directory synchronization, also available for Exchange 2010): Forward by SMTP address via PowerShell.

Note that this *ForwardingMethod* parameter replaces the previous *UseHiddenADContact* boolean parameter, which is deprecated as of version 4.5.

[General] HTMLdoclinks=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1, 2 or 3)	3	Data Migr	3.2

Tells the Data Migration Wizard to migrate Notes DocLinks to Exchange in a particular link format. For example:

HTMLdoclinks=1

... tells the wizard to migrate DocLinks to Exchange as HTML-style links. Valid parameter values are:

0: Migrate DocLinks as Notes-style DocLinks (NDL files), which can be opened in Exchange only if a Notes client is installed on the client workstation.

1: Migrate DocLinks to Exchange as HTML-style links, which can be opened in a web browser if the user is able to use iNotes.

2: Migrate DocLinks in the Notes Migrator for SharePoint format. In this case you must also use the *SharePointServerName* parameter (also in this [General] section) to specify the name of the server where the linked documents reside. (This SharePoint format option added in ver 4.1.2.)

3 (default): Migrate DocLinks to Exchange as Notes links (which will require a Notes client running on end users' desktops to facilitate the rendering of the Notes documents).

For an off-line migration, this parameter must be set to *HTMLdoclinks=0*.

[General] LanguageCode=<SECTIONNAME>

Type:	Default:	Occurs in:	New in:
string	*[null]*	Data Migr	4.12.0

Specifies which set of folder names the Data Migration Wizard should use when assigning folder names to Outlook PST and personal archive folders. The wizard's Task Parameters may contain several sets of PST and personal archive folder names for different locales, differentiated by different [SECTIONNAME]s for the different locales. This parameter simply specifies the name of the locale section that contains the locale-specific PST and personal archive folder names you want the wizard to use for this purpose:

    [General]
    LanguageCode=<SECTIONNAME>

The default is *null*, in which case the wizard uses the section associated with the system locale (of the computer running the wizard). But if (for example) *LanguageCode=DE*, the wizard will use the PST and personal archive folder names defined in the [DE] section of the Task Parameters. Note that there must exist a language section in the Global Defaults to support the SECTIONNAME you specify.

[General] LogDir=<Path>

Type:	Default:	Occurs in:	New in:
string	%temp%	all logging apps, and Log Vwr	3.2

Tells the program where to write its log file. The parameter can specify either a UNC shared directory or a local drive. For example:

    LogDir=\\server\share\

... tells the program to write its log file to the *server\share*\ folder. By default, if the parameter is unspecified, the program writes its log file as *notesdtapp.wlog*, to whatever path is associated with the *%temp%* environment variable. If some other path is specified by this parameter, the filename will be: *COMPUTERNAME-yyyymmdd-hhmmss.wlog*.

[General] LogLevel=<#>

Type:	Default:	Occurs in:
keyword	2	all logging apps, and Log Vwr

Specifies how much detail the program will include in its run logs. Valid values are single digits, $0 \leq x \leq 3$. The default value 2 is suitable for most routine production runs. If you need to diagnose a problem, set the value to 3 (verbose): *LogLevel=3*

[General] LogSkippedAppointmentResponses=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.12.1

Determines whether the Data Migration Wizard's log entries and stats counts for unmigrated items will (1) or will not (0) include appointment responses that were skipped by configuration—by setting [Notes] *MigrateAppointmentResponses=0*. (See the entry for *MigrateAppointmentResponses=<#>*, in the [Notes] section below, for more information about this other option.)

[General] MaxFolderCache=<########>

Type:	Default:	Occurs in:
integer	450	Data Migr

Specifies the number of folders to cache before flushing the cache. Exchange limits the number of objects that can be open at one time. The limit for folders is 500, so if a user has more than 500 folders, the default setting of *MaxFolderCache=450* will tell the Data Migration Wizard to flush the cache at 450, so all folders will migrate.

Valid values are 0 ≤ x ≤ max, where the maximum value is one less than the maximum folder count that is configured on your Exchange server in the registry settings. See this Microsoft article.

If this cache flush feature is turned off (by *MaxFolderCache=0*, so that the cache is unlimited), and a user has more than 500 folders, the folders will not be created, and the wizard will note an error in the log.

[General] MaxLargePstSize=<########>

Type:	Default:	Occurs in:
integer	20480	Data Migr

Specifies the maximum size (in MBs) of large PSTs (Outlook 2003 or later Unicode PST files), beyond which the Data Migration Wizard will split the file into two or more files. For example:

        MaxLargePstSize=40960

This parameter is ignored for users running Outlook 2002 or earlier. Valid values are 0 ≤ x ≤ 51200 (50 GB) for Outlook 2010, Outlook 2013, Outlook 2016, Outlook 2019, and Microsoft 365.or 0 ≤ x ≤ 20480 (20 GB) for earlier Outlook versions. (Versions earlier than Outlook 2010 cannot open a file larger than 20 GB.)

[General] MaxPstSize=<#######>

Type:	Default:	Occurs in:
integer	2048	Data Migr

Specifies the maximum size (in MBs) of PSTs (for Outlook 2002 and earlier PST files), beyond which the Data Migration Wizard will split the file into two or more files. Valid values are 0 ≤ x ≤ 2048.

[General] MergeAddressBookFolder=<FolderName>

Type:	Default:	Occurs in:
string	Contacts	Data Migr

The name of the single folder to which the Data Migration Wizard will merge all migrated address books, if you want to migrate them to a folder other than the default Contacts folder. For example:

        MergeAddressBookFolder=AllContacts

This parameter is ignored if *MergeAddressBooks=0*.

[General] MergeAddressBooks=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

MergeAddressBooks=1 tells the wizard to merge all migrated address books into the single *Contacts* folder, or into a single folder as named by the *MergeAddressBookFolder* parameter (see above). When *MergeAddressBooks=0*, the program will migrate different address books to different folders, one folder per address book.

[General] MigForwarding=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Tells the Data Migration Wizard whether to migrate Notes server-based AutoForwarding rules (if any) to become comparable forwarding rules in Exchange. For example:

MigForwarding=0

... disables the migration of server-based forwarding rules. By default (*MigForwarding=1*) the wizard will migrate Notes forwarding rules. If the Notes forwarding address is a Notes-style address, the address will be added in Exchange as a Notes address only if *AllowForwardtoNotesConnector=1*.

[General] Migrate=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate users** check box in the *Operations* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] MigrateArchives=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Migrate archives check box in the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] MigratePAB=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Migrate personal address books check box in the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] MigrateRecentContacts

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.7

`MigrateRecentContacts=1` tells the wizard/SSDM to migrate the PABs' Recent Contacts list to the folder specified by the `RecentContactsFolder` parameter.

[General] MigrateRecurringBeforeRange=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

Determines whether the wizard will (1) or will not (0) migrate all instances of a recurring appointment or task when the first instance occurs prior to the range of a specified date filter (if any has been defined), but the last instance occurs within or after the date filter range. For example, if a date filter had been defined to migrate only mail and calendar items from October 10 through 25, and a recurring weekly appointment or task has been defined to run three weeks beginning October 1 (so appointments occur on October 1, 8 and 15), then:

> MigrateRecurringBeforeRange=1

… would tell the wizard to migrate all three instances of the series. Likewise, if the same October 10-25 date filter were defined, and a recurring weekly appointment spanned five weeks beginning October 1 (for instances on October 1, 8, 15, 22 and 29), *MigrateRecurringBeforeRange=1* would migrate all five instances.

If *MigrateRecurringBeforeRange=0*, none of the instances of a recurring appointment or task are migrated if the first instance of the series occurs prior to the range of a defined date filter.

[General] MigrateServerMail=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Migrate mail data check box in the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] MinSpace=<###>

Type:	Default:	Occurs in:
integer	100	Data Migr

The minimum disk space, in MB, that must be available on the administrator's migration server for the Data Migration Wizard to run. For example, if:

> MinSpace=200

... and the available disk space on the migration server is only 180MB, the wizard will display an error message and abandon its run.

[General] MsgRequireAnyFeature=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1, 2, 4 or 7)	0	Data Migr	4.1.5

Tells the Data Migration Wizard which types of messages to migrate, depending on the features of each message. The parameter value must be one of these single-digit numeric keywords:

> 0 (default): Migrate all items.
> 1: Migrate only items with embedded OLE objects.

2: Migrate only items with inline MIME attachments.
4: Migrate only items with Notes RTF bodies with bitmaps.
7: Migrate only items with one or more of the features listed above.

For example: *MsgRequireAnyFeature=2* tells the wizard to migrate only messages with inline MIME attachments.

[General] NeedUpgradeTemplate=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.0

When set to (1), the MNE console navigation drawer displays the option **Upgrade Templates**. When selected, MNE upgrades all the full templates in the database to differential templates. Differential templates pick up changes made to the Global Default settings.

After the templates have been upgraded, the parameter is set to (0). You should not configure this parameter directly, it is set by program.

[General] PABDest=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	server	Data Migr

The destination for migrated Personal Address Books data. Valid values are "PST" or "server". For example:

    PABDest=PST

If PABDest=server, the *PABDestServerArchive* parameter (documented separately below) determines whether PABs will be migrated to users' server-mail mailboxes or personal-archive mailboxes.

[General] PABDestServerArchive=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.4.1

Determines whether PABs will be migrated to users' server-mail mailboxes (0) or personal-archive mailboxes (1). For example: *PABDestServerArchive=1* tells the wizard to migrate users' PABs to their personal-archive mailboxes. Note that this *PABDestServerArchive* parameter is relevant only if *PABDest=server* (as documented above). If *PABDest=pst*, this *PABDestServerArchive* parameter is ignored.

[General] PostLogs=<#>

Type:	Default:	Occurs in:
boolean	1	NMM

This value corresponds to a GUI element in the Notes Migration Manager: the **Post user logs to the central directory** check box in the *Shared Directories Configuration* screen. The program writes the value from an admin's GUI entry to the NMM Task Parameters, and also (the same value) to a corresponding *PostLogs* parameter and a *SendStatus* parameter in the [General] section of the *notesdtapp.ini* file (for the SSDM). (For more information, see the *PostLogs* and *SendStatus* parameters in the *notesdtapp.ini* pages of this *Reference*.) Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] PromptUpgradeTemplate=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.0

When set to (1), MNE prompts the user to upgrades all the full templates in the database to differential templates when the MNE console is launched. Differential templates pick up changes made to the Global Default settings.

After the templates have been upgraded or the customer selects "Don't ask me again", the parameter is set to (0). You should not configure this parameter directly, it is set by program.

[General] ProxyAccessType=<keyword>
[General] ProxyAuthMechanismType=<keyword>
[General] ProxyUserName=<string>
[General] ~ProxyPassword=<string>

These several parameters together configure Migrator for Notes to Exchange proxy settings, to better facilitate connections to Microsoft 365 and other hosted platforms when using a proxy server to connect to the Internet. These parameters pertain only to PowerShell operations, and also require that MAPI proxy access be configured through Windows' Internet Options dialog box. This Quest KnowledgeBase article explains how to configure a proxy server in Windows that will allow Migrator for Notes to Exchange to connect to Microsoft 365.

Introduced in version 4.5.2, these parameters occur in the Provisioning Wizard and Data Migration Wizard.

Note that not all enumerations of AuthenticationMechanism or AccessType are supported by the PSSessionOption object (according to PowerShell documentation). Supported values are listed here.

ProxyAccessType can be set to any of these values:

- AutoDetect: Forces auto-detection of the access type for the proxy configuration.

- IEConfig: Internet Explorer proxy configuration for the current active network connection is used.

- None: The proxy access type is not specified. This means that proxy information, such as ProxyAccessType, ProxyAuthenticationMechanism, and ProxyCredential, is not passed to the WSMan service.

- NoProxyServer: Do not use a proxy server when configuring proxy settings. This mechanism resolves all the host names locally.

- WinHttpConfig: Proxy settings are configured for WinHTTP using the ProxyCfg.exe utility (prior to Win 7) or netsh.exe (for Win 7 or later).

ProxyAuthMechanismType can be set to any of these values:

- Basic: The connection is made using Basic authentication.

- Digest: The connection is made using Digest authentication. Digest authentication operates much like Basic authentication. However, unlike Basic authentication, Digest authentication transmits credentials across the network as a hash value, also known as a message digest. The user name and password cannot be deciphered from the hash value. In comparison, Basic authentication sends a Base 64 encoded password, essentially in clear text, across the network.

- Negotiate (default): The connection is made using Kerberos or NTLM. The server uses Kerberos to authenticate a domain account and NTLM for local computer accounts. The user name should be specified in the form domain\username for domain users or servername\username for local users on a server computer.

ProxyUserName must also be specified for some types of authentication.

~ProxyPassword must also be specified for some types of authentication.

[General] PstDirErrList=<FullPathAndFilename>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[General] PublicDelegates=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.1.1

Tells the Data Migration Wizard whether to migrate Notes' "send on behalf of" delegation rights. The wizard migrates these rights by default (1), but this feature can be disabled by: *PublicDelegates=0*

[General] RecentContactsFolder

Type:	Default:	Occurs in:	New in:
string	Recent Contacts	Data Migr	4.7

Specifies the name of the folder to which the PAB's Recent Contacts list will be migrated. This parameter is ignored if `MigrateRecentContacts=0`.

[General] ResetMigAppWorkItems=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Q Sched	4.6

Determines whether Migrator for Notes to Exchange's scheduling application (*Qsched.exe*) will reset recurring work items back to a "ready" state upon launch. Before this parameter was introduced, the reset was automatically applied and sometimes caused users to migrate multiple times. The default (*ResetMigAppWorkItems=0*) does not reset work items to a "ready" state for recurring tasks. To enable the feature (the behavior in earlier releases), set *ResetMigAppWorkItems=1*. Quest recommends this feature always be disabled (0) if you are attempting a balanced migration across multiple machines.

[General] RunAsService=<#>

Type:	Default:	Occurs in:	New in:	**Deprecated** in:
boolean	0	Q Sched	4.5.4	4.9.0

Determines whether Migrator for Notes to Exchange's scheduling application (*QSched.exe*) will run as a service, which in turn loads the MAPI subsystem in a "running as service" context, so MAPI will not try to display a log-in prompt to the user. For example, *RunAsService=1* tells QSched to run as a service. By default (0), QSched will not run as a service—as in prior Migrator for Notes to Exchange releases.

When running as a service, MAPI uses the credentials of the currently logged-in user (in this case, the account under which the service is running). When running Migrator for Notes to Exchange this way, the service must be running as the Exchange user normally configured in the Migrator for Notes to Exchange console.

Due to changes in the scheduling service, this parameter is deprecated in version 4.9.0 and higher.

[General] ServerMailDest=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	server	Data Migr

Sets the destination for migrated server mail. Valid values are "PST" or "server". For example:

        ServerMailDest=PST

If *ServerMailDest=server*, the *ServerMailDestServerArchive* parameter (documented separately below) determines whether server mail will be migrated to users' server-mail mailboxes or personal-archive mailboxes.

[General] ServerMailDestServerArchive=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.4.1

Determines whether server mail will be migrated to the users' server-mail mailboxes (0) or personal-archive mailboxes (1). For example: *ServerMailDestServerArchive=1* tells the wizard to migrate users' server mail to their personal-archive mailboxes.

Note that this *ServerMailDestServerArchive* parameter is relevant only if *ServerMailDest=server* (as documented above). If *ServerMailDest=pst*, this *ServerMailDestServerArchive* parameter is ignored.

[General] SharePointServerName=<ServerName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Specifies the name of the SharePoint server where the Proposion-linked documents reside, if *HTMLdoclinks=2* (in this same [General] section). For example:

    SharePointServerName=Banff

[General] ShowSetMailDomain=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.2.0

Determines whether the Data Migration Wizard will (1) or will not (0) display an optional set of fields, on its *Select Notes Administrative Operations* screen, that let the admin set the domain values for the source mail domain, calendar domain, and mail system. For example:

    ShowSetMailDomain=1

... tells the wizard to display the fields. When *ShowSetMailDomain=1*, these other parameters (in the [Notes] section of these parameter settings) may be used to set the default values for the corresponding fields:

    DoSetMailDomain=<#>
    FwdMailDomain=<domain>
    DoSetCalDomain=<#>
    FwdCalDomain=<domain>
    DoSetMailSystem=<#>
    MailSystem=<#>

[General] SkipOutOfRangeExceptions=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

Determines whether the wizard will (0) or will not (1) migrate an exception to a recurring appointment or task when the original or rescheduled start time falls outside the range of a defined date filter (if any). This parameter does not control whether such an instance would be migrated at all, but only whether the instance would be migrated as originally scheduled, or as it was changed. If, for example:

    SkipOutOfRangeExceptions=1

… and one instance of a recurring series was originally scheduled for October 1 but had been changed to October 2, and if that instance occurs outside a defined date filter range, the wizard skips the exception—i.e., will migrate the instance at its original October 1 time rather than as changed, to October 2. If *SkipOutOfRangeExceptions=0* (default), the wizard would migrate the instance as changed, for October 2.

[General] SMTPTranslationTable=<PathSpecification>

Type:	Default:	Occurs in:
string	[none]	NMM, Dir Exp, Data Loc, PAB Replic, Data Migr

Specifies the path and filename of the SMTP Translation Table: a data file generated by the Directory Export Wizard and used by other Quest applications and wizards to convert addresses in messages, address books, and contacts to the appropriate Internet (SMTP) address for each user. The Directory Export Wizard writes this value to the Task Parameters automatically; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] SQLCredentials=<value>

Type:	Default:	Occurs in:
string	[none]	Data Migr

This value, automatically generated from values in the SQL *Server Configuration* screen of Notes Migration Manager, is used by the Data Migration Wizard to access necessary licensing information during the migration process. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] ThreadCnt=<##>

Type:	Default:	Occurs in:
integer	[none]	Data Migr

This value, representing the number of simultaneous processes the program will use to perform migrations, corresponds to a GUI element in the Data Migration Wizard, the **Number of migration threads** field in the *Specify Migration Run Information* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change the value except at the direction of Quest Support.

[General] UseFilteredAttachmentMsg=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.2.0

Determines whether the Data Migration Wizard will insert a default message (0) or a customized message (1) to replace an attachment that the wizard has removed from a migrating message because it is encrypted or because the attachment exceeds a size limit. The wizard removes such an attachment from a migrating message, and replaces it with an explanatory note. The explanatory note can be either a default explanation, or some custom-ized message from a text file specified by a separate parameter (either *AttachmentLostDueToEncryptionMsg* or *AttachmentFilteredbySizeMsg*, as described above).

For example, *UseFilteredAttachmentMsg=1* tells the wizard to insert the customized message. This feature is also an option in the SSDM (same parameter, but in *notesdtapp.ini*).

[General] UseFilteredBodyMsg=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.2.0

Determines whether the Data Migration Wizard will insert a default message or a customized message to replace the encrypted body of a migrated encrypted message. The wizard removes the message body from every encrypted message it migrates, and replaces it with an explanatory note. The explanatory note can be either the default ("An encrypted bodypart was discarded"), or some customized message from a text file specified by the separate *BodyLostDueToEncryptionMsg* parameter (see above). For example:

    UseFilteredBodyMsg=1

... tells the wizard to insert the customized message. This feature is also an option in the SSDM (same parameter, but in *notesdtapp.ini*).

[General] UseLargePsts=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

UseLargePsts=0 forces the program to not use large PSTs, whereas by default (1) the program will use large PSTs if possible. Note: A setting of 1 will not force Unicode PSTs if Outlook 2003 or later is not installed. The program cannot create PSTs without the proper MAPI components (from Outlook 2003 or later) in place.

[General] UserErrList=<FullPathAndFilename>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[General] UseSeparatePSTS=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

    UseSeparatePSTS=0

... tells the wizard to migrate all data into a single pst file per user. The default is 1, so data is migrated into multiple psts.

[General] WatchdogMinutes=<##>

Type:	Default:	Occurs in:	Default changed in:
integer	180	Data Migr	4.7

Specifies the number of minutes of inactivity the Data Migration Wizard will wait within a program run before assuming a process has encountered a fatal error, and abandoning the process. For example:
WatchdogMinutes=60

Migration to hosted platforms often generates more process timeouts than migration to a local server, particularly when migrating quantities of large messages (usually due to large attachments). We therefore recommend the default *watchdogminutes=180* for connections to Microsoft 365, to make the migration program "forgiving." A substantially lower setting of, say, *watchdogminutes=30* might be better suited to migration to a local server, where shorter and higher-quality transmission paths make timeouts less common.

A value of 0 tells the wizard to wait indefinitely (forever) for activity, rather than reporting a fatal error has occurred after some period of time.

[General] WorkerRestartDelaySeconds=<##>

Type:	Default:	Occurs in:
integer	10	Data Migr

Specifies the number of seconds the Data Migration Wizard will wait before restarting a migration which has encountered MAPI errors specified in the MAPIErrorsToRetry parameter. For example:

    WorkerRestartDelaySeconds=30

[IncludeFoldersAndViews] section

[IncludeFoldersAndViews]
Include<#>=<FolderName>
Include<#>=<ViewName>

Type:	Default:	Occurs in:	New in:
string	none	Data Migr	4.15

Each line specifies a folder or view name. The specified folder or view is included with the migration. For example:

[IncludeFoldersAndViews]

Include0=My Folder

Include1=My View

Folders can be included or excluded by setting `[Filters]`, `[FolderTreeFilters]`, and `[IncludeFoldersAndViews]`. The precedence order is `[Filters] > [IncludeFoldersAndViews] > [FolderTreeFilters]`.

- If a folder is named in both the `[Filters]` section and the `[IncludeFoldersAndViews]` section, the `[Filters]` section takes precedence and the folder or view is not migrated.

- If a folder is named in both the `[IncludeFoldersAndViews]` and the `[FolderTreeFilters]`, the `[IncludeFoldersAndViews]` sections take precedence and the folder or view is migrated. Since the `[FolderTreeFilters]` section impacts the sub folders, the sub folders are still excluded if they are not named in the `[IncludeFoldersAndViews]`.

[MigrationSummary] section

All parameters in the [MigrationSummary] section are internal transient parameters. These parameters are used by the program to associate the template file used by the [Notify] AdminSummaryTemplate setting to generate the body of the migration summary email. Manual modification of these parameters is meaningless and has no effect on the program or data, since existing parameter values are overwritten by the program when it runs. Parameters in this section include:

- `CollectionName=`

- `ElapsedTime=`

- `ProcessedItemCount=`

- `ProcessedItemSize=`

- `SourceItemSize=`

- `ThroughputProcessedItemCount=`

- `ThroughputProcessedItemSize=`

- `ThroughputSourceItemSize=`

- `TotalAppointmentsTasksMigratedCount=`

- `TotalAppointmentsTasksRemigratedCount=`

- `TotalAppointmentsTasksFilteredCount=`

- `TotalAppointmentsTasksSkippedCount=`

- `TotalAttachmentFilteredCount=`

- `TotalAttachmentFilteredSize=`

- `TotalContactMigratedCount=`

- `TotalDoneUserCount=`

- `TotalEncryptedAppointmentsTasksFilteredCount=`

- `TotalEncryptedAppointmentsTasksMigratedCount=`

- `TotalEncryptedAppointmentsTasksRemigratedCount=`

- `TotalEncryptedAppointmentsTasksSkippedCount=`

- `TotalEncryptedMailFilteredCount=`

- `TotalEncryptedMailMigratedCount=`

- `TotalEncryptedMailMigratedSize=`

- `TotalEncryptedMailRemigratedCount=`

- `TotalEncryptedMailRemigratedSize=`

- `TotalEncryptedMailSkippedCount=`

- `TotalErrorCount=`

- `TotalErrorUserCount`

- `TotalMailFilteredCount`

- `TotalMailMigratedCount=`

- `TotalMailMigratedSize=`

- `TotalMailRemigratedCount=`

- `TotalMailRemigratedSize=`

- `TotalMailSkippedCount=`

- `TotalWarningCount=`

[MsOnlinePSConnectionUris] section

This section contains a list of PowerShell URLs for each of the Microsoft 365 clouds that are supported by MNE. These values are used by the Migration Console's Exchange Server page to set the `[Exchange]` `O365PSConnectionUri` setting.

The values in this section should only be modified at the direction of Quest support.

[MsOnlineSmtpHosts] section

This section contains a list of the Microsoft 365 host URLs for each of the Microsoft 365 clouds that are supported by MNE. These values are used by the Migration Console's Exchange Server page to set the `[Notify]` `SMTPHost` setting.

The values in this section should only be modified at the direction of Quest support.

[Notes] section

[Notes] ACLIgnore<#>=<AlphanumString>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

These parameters correspond to GUI elements in the Data Locator Wizard, each ACLIgnore<#> parameter identifies a single user in the **Selected Users** box of the *Select Administrative Users to Ignore* screen. The digit(s) appended to an ACLIgnore<#> key name differentiate one parameter from another. For example:

> ACLIgnore0=Addison David
> ACLIgnore1=Adeline Awbrite
> ACLIgnore2=Albert Eisensteiner
> ACLIgnore3=Baba Wawa

The wizard writes these values to the Task Parameters from the GUI entries; Quest recommends you do not manually enter or change this value except at the direction of Quest Support. Multiple *ACLIgnore<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. But the wizard will read only *ACLIgnore<#>* parameters whose differentiating digits are less than a value specified by an *ACLIgnoreCount* parameter (see below) in this same [Notes] section.

[Notes] ACLIgnoreCount=<value>

Type:	Default:	Occurs in:
integer	[GUI entry]	Data Loc

A limit to the number of *ACLIgnore<#>* parameters (see above) that the Data Locator Wizard will process in this section. The wizard will read only *ACLIgnore<#>* parameters whose differentiating digits are less than this *ACLIgnoreCount* parameter value. For example, if:

```
[Notes]
ACLIgnoreCount=4
ACLIgnore0=Addison David
ACLIgnore1=Adeline Awbrite
ACLIgnore2=Albert Eisensteiner
ACLIgnore3=Baba Wawa
ACLIgnore4=Carlton Yerdoorman
ACLIgnore5=David Addison
```

... the wizard reads all the parameters except *ACLIgnore4* and *ACLIgnore5*, since *ACLIgnoreCount=4*, and neither 4 nor 5 is less than 4.

[Notes] ActiveMailTypes

Type:	Default:	Occurs in:	New in:
integer	31	Data Migr	4.11

When Active Mail Processing is enabled, this parameter determines what type of Active Mail should be processed. This parameter is implemented as a set of bit flags where each bit corresponds with a specific type of active mail to be processed. The following bit values are supported:

- 1 – Notes Encrypted Mail

- 2 – Stored forms (created in Notes with Store form in document)

- 4 – Embedded buttons, hotspots, collapsible sections, etc.

- 8 – Unsupported Rich Text Elements

- 16 – Messages that are missing the "Form" field

- 32 – Dropdown sections

The default value for this parameter is 31, meaning that when Active Mail Processing is enabled, MNE will process all types of active mail except for dropdown sections.

The Migration Wizard includes a configuration dialog where the active mail types can be configured. However, it only includes check boxes for the first four types, allowing you to disable one or more of these types of active mail. To disable active mail processing of Missing Form Field messages, or to enable the processing of messages with dropdown sections, the `ActiveMailTypes` setting must be manually configured in the Default Global Settings.

For example, to configure MNE to process all types of active mail, add the following setting to the default global settings:

```
[Notes]
ActiveMailTypes=63
```

[Notes] AllowNotesForeignDirSync=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.1.5

This value corresponds to a GUI element in the Data Migration Wizard, the Allow foreign directory synchronization check box in the *Specify Remove Notes Forwarding Settings* screen. The wizard writes this value to the Task

Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

This parameter is used only with Manage mail routing, when removing Notes forwarding attributes. For example:

    AllowNotesForeignDirSync=0

... tells the wizard to set Foreign Directory Synchronization in the Notes person document to No, while a value of 1 would set it to Yes.

[Notes] AlwaysDoForwarding=<#>

Type:	Default:	Occurs in:	New in:
keyword	0	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Overwrite existing mail forwarding address** radio buttons in the *Specify Notes to Exchange Mail Forwarding* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support. The parameter value tells the wizard whether to set, update or remove mail-forwarding rules, per the administrator's instructions in other program entries, even if the wizard detects an existing forwarding address or rule already in place for a particular user. Valid values are single-digit numeric:

0 (default): The wizard will not set, update or remove existing forwarding unless the new forwarding domain matches the domain of the existing forwarding address—a precaution to prevent the inadvertent overwriting or removal of existing forwarding rules that have nothing to do with migration.

> 1: The wizard will always change any existing forwarding, regardless of the existing forwarding address.
> 2: The wizard will never change any existing forwarding.

[Notes] AlwaysRmvForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Always** vs. **Only if...** radio buttons under **Remove existing MailForwarding address**, in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support. The boolean parameter value tells the wizard whether it should refrain from removing an existing forwarding address or rule in Notes if its domain does not match a *ForwardingDomain* parameter value (also in this [Notes] section, and also derived from a GUI entry in the same screen):

> 0: Remove forwarding only if domain matches.
> 1: Always remove forwarding, regardless of domain.

[Notes] AlwaysUseDefaults=<#>

Type:	Default:	Occurs in:
boolean	0	NMM, Dir Exp, Data Loc, NABs Disc, Doms Disc, Data Migr, PAB Replic

This value corresponds to a check box GUI element in the Notes Migration Manager: the **Always use these values** field in the *Notes Server Configuration* screen. The value determines whether the wizards that need this information will always use the access credentials entered into the corresponding *Notes Server Configuration* screen. For example, if:

    AlwaysUseDefaults=1

... a wizard will skip the screen that requests this information, saving the admin the trouble of having to reenter the values and manually dismiss the screen. By default (*AlwaysUseDefaults=0*), the wizard will take the values entered in Notes Migration Manager as its defaults, but will display the screen to offer the option of accepting or changing the default credentials.

[Notes] AppointmentForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Permits the designation of alternate names for appointment forms to migrate. For example:

```
AppointmentForms=appointment
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
AppointmentForms=appointment|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] AppointmentLocationSource=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1, 2, 3 or 4)	1	Data Migr	4.4.1

Determines how Migrator for Notes to Exchange will fill the *Location* field of a migrated appointment. The parameter value tells the migrator which Notes field to copy into an appointment's *Location* field, depending on whether the source field is empty: *AppointmentLocationSource=<#>*

Valid values are these five single-digit keywords:

> 0: FAVOR_LOCATION (try to use Location, but if it is empty use Room)
> 1 (default): FAVOR_ROOM (try to use Room, but if it is empty use Location)
> 2: ALWAYS_LOCATION (use Location, even if it is empty)
> 3: ALWAYS_ROOM (use Room, even if it is empty)
> 4: Retain both room and location.

[Notes] ArchiveDesignClass=<DesignClassName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

> ArchiveDesignClass=class2

... tells the Data Migration Wizard to recognize *class2* as an additional design class (in addition to the default design class) for Archive NSF files. If the wizard finds an NSF file that does not match any of the program's default design classes for Archive, Mail or PAB files, the wizard will look at this parameter (and the comparable *MailDesignClass* and *PABDesignClass* parameters) to find an alternate design class, and thereby determine the file type. To designate more than one additional design class for Archive files, use the pipe character (|) to separate between class names, like this: *class2|class3|class4*

[Notes] ArchiveDir=<DirectorySpecification>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the Root directories box in the *Specify Notes Archive Directories* screen. One or more directories may be specified within the single parameter value. To define more than one, use a pipe character (|) to separate each pair. Example:

ArchiveDir=\\folder\data\arch1 | \\folder\data\arch2 | \\folder\data\arch3 | ...

The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] ArchiveReplicaDir=<DirectorySpecification>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the Directory text box in the *Specify Notes Archive Replica Directory* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] ArchiveReplicaServer=<Server>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the Server text box in the *Specify Notes Archive Replica Directory* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] CountIntentionallySkippedItems=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.12.1

Determines whether the Data Migration Wizard's logging and statistics for unmigrated items will include or exclude items that do not appear in the *FailedMessageList* skipped-items folder because they were intentionally skipped. (The *FailedMessageList* feature is described in separate entries for the *WriteFailedMessageList...* parameters, also in this [Notes] section.)

For example, the program will intentionally skip PAB Replicator messages or calendar items if these items have not been selected for migration, but they will not appear in the *FailedMessageList* skipped-items folder since they were deliberately excluded from the migration. This *CountIntentionallySkippedItems* parameter lets you choose whether MNE should still count these items in its skipped-items statistics, and report them in its logs.

By default (1), the log and statistics will include items that have been skipped but do not appear in the skipped-items folder. To disable logging and counting such items, set *CountIntentionallySkippedItems=0*. Note also:

- Any setting for this *CountIntentionallySkippedItems* parameter is ignored if the *FailedMessageList* feature is disabled.

- A setting of *CountIntentionallySkippedItems=0* will override *[General] LogSkippedAppointment-Responses=1* (so the program will not log or count skipped appointment responses).

[Notes] CreateFwdAddrInAD=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the Verify source forwarding address… text box in the *Specify Notes to Exchange Mail Forwarding* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The default value of 1 corresponds to a selected check box, and tells the wizard to validate the email address in Active Directory before setting it as a forwarding address in Notes. But validating the AD address can cause

problems when an email address does not exist in AD (for example, in a BPOS-S migration), since Migrator for Notes to Exchange does not set the forwarding address in Notes.

[Notes] CustomAttr<#>=<AttributeName>

Type:	Default:	Occurs in:	New in:
string	[none]	Dir Exp	4.1.1

Each CustomAttr<#> parameter specifies a Notes custom attribute whose values you want the Directory Export Wizard to capture and export to the SQL Server migration data tables. The Collection Wizard can use these attributes as a basis for member selection to various collections. The CustomAttr<#> parameter(s) let you define which of Notes' custom attributes you want the Directory Export Wizard to capture. For example:

```
[Notes]
CustomAttr1=Name_of_a_Notes_Attrib
CustomAttr2=Name_of_Another_Notes_Attrib
CustomAttr3=Name_of_Some_Other_Notes_Attrib
CustomAttr4=Name_of_Yet_Another_Notes_Attrib
```

These *CustomAttr<#>* parameters must be defined in the Global Defaults.

You can use any defined custom attribute as a way to select members for a collection. For example, if you define *CustomAttr1=SaladDressing* (a Notes attribute named "SaladDressing"), the Directory Export captures all the user values for the *SaladDressing* attribute. You could create a collection by selecting only members for whom *SaladDressing=Italian*. In the *Add Members* screen, defined attributes like "SaladDressing" will appear in the **Attribute** drop-down list box as additional options.

The digits appended to a *CustomAttr<#>* key name differentiate one parameter from another. You may define as many as ten attributes to capture, *CustomAttr1* through *CustomAttr10*.

[Notes] DateFilterUsingFormula=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Controls whether the Data Migration Wizard will use a newer processing method to improve performance when migrating with a date filter, or use the older original method. The program default (1) is to use the newer method, but *DateFilterUsingFormula=0* tells the program to use the original method instead.

[Notes] DeleteMailDomain=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

```
DeleteMailDomain=1
```

... tells the Data Migration Wizard to clear users' Domain fields in their Notes records as the wizard sets forwarding. (The Domain fields are a feature of the Notes environment, but do not appear in the Quest application GUI.) This can be helpful in some circumstances where the Domain fields might impede mail-routing out of the Notes environment. This feature is disabled by default (0), so the fields are not cleared.

[Notes] DisableDirsync=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

Determines whether Migrator for Notes to Exchange will set foreign directory synchronization according to the set-ting for the *SourceAdminDirSync* parameter (also in this [Notes] section), which defaults to 0 (disable). This value corresponds to a GUI element in the Data Migration Wizard, the **Set foreign directory sync** check box in the *Select Notes Administrative Operations* screen. The wizard writes this value to the Task Parameters from an

admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DisableNotesForeignDirSync=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.14.0

When the **Manage mail routing** operation is used to configure forwarding of Notes email to Exchange, the Notes `AvailableForDirsync` attribute in the user's person document is updated if mail co-existence is handled using Quest Coexistence Manager for Notes. By default, the `AvailableForDirsync` attribute is updated by setting it to "0", which disables Notes foreign directory sync. To allow Notes foreign directory sync to continue, set this parameter to "0" and `AvailableForDirsync` will be set to "1" instead.

[Notes] DisableNotesUsersAfterMigration=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1 or 2)	0	Data Migr	4.7

Determines whether the wizard will disable Notes users after migration, or not, or undo the disabling of Notes users in a prior run of the wizard. The parameter takes a single-digit keyword, which must be of these three valid options:

> 0: Do not disable users after migration.
> 1: Disable Notes users after migration.
> 2: Undo previous disable of users after migration.

[Notes] DocLinksDefaultServer=<ServerName>

Type:	Default:	Occurs in:
string	[null]	Data Migr

Specifies the name of a Domino server that the Data Migration Wizard will use to compose HTTP- or Notes-style DocLink URLs if it cannot find the server by its own lookup method (as specified by the *DocLinksFastLookupOnly* parameter, described below). The parameter value is a string specifying the name of the server. The specified server name must be the TCP/IP server name (e.g., *bighat.itsfunny.com*), and *not* a Domino server name (*bighat/itsfunny*).

If the designated lookup method fails to find the server, Migrator for Notes to Exchange will use the server name specified by *DocLinksDefaultServer* or, if no *DocLinksDefaultServer* is specified (default is *null*), will migrate the item without the DocLink.

[Notes] DocLinksFastLookupOnly=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Determines the method the Data Migration Wizard will use to look up the server for an HTTP- or Notes-style DocLink. By default (1), the wizard will use only a new, faster method introduced in Migrator for Notes to Exchange version 4.5.0. Or you can revert to the earlier method by setting *DocLinksFastLookupOnly=0*. (Quest has not observed any case where the older method was more reliable than the faster new method.)

If neither method finds the server, the wizard will use the server name specified by the *DocLinksDefaultServer* parameter (see above) or, if no *DocLinksDefaultServer* is specified, will migrate the item without the DocLink.

[Notes] DocLinksHttpPort=<#>

Type:	Default:	Occurs in:
integer	80	Data Migr

Tells the Data Migration Wizard which port to insert into a DocLink URL upon migration of a DocLink. If unspecified, the wizard will use port 80.

[Notes] DocLinksPreferCNForNotesUrl=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.15.1

Determines if the Notes links uses a Domino Server CN name instead of a Domino Server NetAddress when `[General] HTMLdoclinks=3`, migrate DocLinks to Exchange as Notes links (the default). When `DocLinksPreferCNForNotesURL` is set to the default value (0), the Domino Server NetAddress is used.

For example, if the Domino server is configured as follows:
Domino Server CN name = MNE-AUTO-D901
Domino Server NetAddress = MNE-AUTO-D901.prod.quest.corp

- If `[General] HTMLdoclinks=3` and `[Notes] DocLinkPreferCNForNotesUrl=0`,
  the Migrated DocLink = notes://MNE-AUTO-D901.prod.quest.corp/db/view/document

- If `[General] HTMLdoclinks=3` and `[Notes] DocLinkPreferCNForNotesUrl=1`,
  the Migrated DocLink = notes://MNE-AUTO-D901/db/view/document

[Notes] DominoDomain=<DomainName>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Specify your Domino domain text box in the *Specify Notes to Exchange Mail Forwarding* screen. The field specifies the root (highest-ranking) domain containing the Domino server. If, for example, the server is *server/xyzcorp*, this field value should be *xyzcorp*. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoNotesMailRouting=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Forwarding does not need to be removed...** check box in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoNotResolveNonNetworkAttendee=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.5.4

Determines whether the Data Migration Wizard will relay a Notes attendee's name as a text string in the list of meeting attendees, but not attempt to match the name with an AD object. For example:

    DoNotResolveNonNetworkAttendee=1

... tells the wizard to enable this feature and copy the text string of an attendee's name into an invitation if the value does not contain either the @ or / character, or the string *CN=*. By default (0), this feature is disabled, and the wizard will associate such a name with a corresponding name in AD.

This feature is useful when no SMTP address is associated with the attendee in the Notes source, because it prevents the wizard from erroneously mapping an attendee with no SMTP address to a Notes user with the same name. This eliminates the possibility of a cancellation or reschedule notice being sent to an internal employee in the GAL who was never invited to the meeting.

[Notes] DoRmvForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Remove existing MailForwarding address** check box in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoSetCalDomain=<#>

Type:	Default:	Occurs in:	Expanded in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Set Calendar Domain** check box in the *Specify Notes to Exchange Mail Forwarding* screen, and the **Set Calendar Domain** check box in the *Remove Existing Forwarding from Notes* screen. The administrator's entry in the *Specify Notes to Exchange Mail Forwarding* screen sets the default display in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoSetForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Set Mail Forwarding address check box in the *Specify Notes to Exchange Mail Forwarding* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoSetMailDomain=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Set Mail Domain** check box in the *Specify Notes to Exchange Mail Forwarding* screen, and the **Set Mail Domain** check box in the *Remove Existing Forwarding from Notes* screen. The administrator's entry in the *Specify Notes to Exchange Mail Forwarding* screen sets the default display in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoSetMailSystem=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Set MailSystem** check box in the *Specify Notes to Exchange Mail Forwarding* screen, and the **Set MailSystem** check box in the *Remove Existing Forwarding from Notes* screen. The administrator's entry in the *Specify Notes to Exchange Mail Forwarding* screen sets the default display in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] DoSetNotesFormatPreference=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

This value corresponds to a GUI element in the Data Migration Wizard, the **Set format preference** check box in the *Specify Remove Notes Forwarding Settings* screen. Used only with **Manage mail routing**, when removing Notes forwarding attributes, this parameter determines whether the wizard will enable the adjacent drop-down list box, in which the admin must specify how to set the Notes Format preference for incoming mail parameter. (The selected value is saved to the *NotesFormatPreference* parameter, also in this [Notes] section, and documented separately below). For example: *DoSetNotesFormatPreference=1* tells the wizard to enable the drop-down list box, while the default value of 0 tells the wizard to disable the drop-down list box.

The wizard writes this value to the Task Parameters depending on whether the admin marks (1) or unmarks (0) the check box. Quest recommends you do not enter or change this value except at the direction of Quest Support.

[Notes] DoShowRmvForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to GUI elements in the *Specify Mail Routing Options* screen of the Data Migration Wizard, the **Notes** vs. **Exchange** radio buttons under **All new mail ... will be delivered to**. The wizard automatically sets the values of this and three other related parameters (shown below) according to the administrator's radio-button choice, to tell the wizard which mail-routing screens to display in the current run. This *DoShowRmvForwarding* value in the [Notes] section determines whether the wizard will (1) or will not (0) display its *Remove Existing Forwarding from Notes* screen. The full set of related parameters, and how they are set:

If Notes destination is selected:	If Exchange destination is selected:
[Exchange] DoShowSetForwarding=1 DoShowRmvForwarding=0	[Exchange] DoShowSetForwarding=0 DoShowRmvForwarding=1
[Notes] DoShowSetForwarding=0 DoShowRmvForwarding=1	[Notes] DoShowSetForwarding=1 DoShowRmvForwarding=0

Quest recommends you do not manually enter or change these values except at the direction of Quest Support.

[Notes] DoShowSetForwarding=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.1

This value corresponds to GUI elements in the *Specify Mail Routing Options* screen of the Data Migration Wizard, the **Notes** vs. **Exchange** radio buttons under **All new mail ... will be delivered to**. The wizard automatically sets the values of this and three other related parameters (shown below) according to the administrator's radio-button choice, to tell the wizard which mail-routing screens to display in the current run. This *DoShowSetForwarding* value in the [Notes] section determines whether the wizard will (1) or will not (0) display its *Specify Notes to Exchange Mail Forwarding* screen. The full set of related parameters, and how they are set:

If Notes destination is selected:	If Exchange destination is selected:
[Exchange] DoShowSetForwarding=1 DoShowRmvForwarding=0	[Exchange] DoShowSetForwarding=0 DoShowRmvForwarding=1
[Notes] DoShowSetForwarding=0 DoShowRmvForwarding=1	[Notes] DoShowSetForwarding=1 DoShowRmvForwarding=0

Quest recommends you do not manually enter or change these parameter values except at the direction of Quest Support.

[Notes] DoVisibility=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Wizard, the **Set user visibility** check box in the *Select Notes Administrative Operations* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] ElevateCalendarAuthorACLtoEditor=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.7

Determines (in conjunction with the parameter *[Notes] MapDefaultAclToReviewer*) how the wizard maps some Notes access levels to Exchange, for calendar and to-do items. Specifically, the *No Access* and the *Depositor* access levels are mapped as shown in the following table, for selected *Read Public* and *Write Public* Notes permissions.

Read Public	Write Public	Migrator for Notes to Exchange **Parameter Settings** (defaults are shown here in red)	Exchange Calendar / ToDo Access Rights
No	[—————— any combination ——————]		No Access
Yes	No	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=1	Reviewer
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0 or 1	Reviewer
	Yes	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 or 1 ElevateCalendarAuthorACLtoEditor=1	Editor
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0	Author

[Notes] ElevateMailInDBEditorAclToFullAccess=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.15.2

When `ElevateMailInDBEditorAclToFullAccess=1`, the Data Migration Wizard elevates Notes' Manager, Designer, and Editor access levels for the Mail-In database which have "Delete documents" rights to Full Access permission in the Exchange Shared mailbox. By default (0), this feature is disabled.

[Notes] EncryptedMailOnly=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.2.0

Determines whether the Data Migration Wizard will migrate both encrypted and non-encrypted mail (0), or migrate encrypted mail only (1). For example: *EncryptedMailOnly=1* tells the wizard to migrate only encrypted mail. This feature is also an option in the SSDM (same parameter, but in *notesdtapp.ini*).

[Notes] ExcalconServer=<string>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.1.5

Specifies the value to be set for the **Mail Server** setting in the Notes person document. This parameter is used only with **Manage mail routing**, when setting Notes attributes, and only when Coexistence Manager for Notes has been selected for email and calendar coexistence (that is, *MailViaConnector=3*)

For example:

        ExcalconServer=ServerName

… tells the wizard to set the **Mail Server** value to "ServerName."

[Notes] ExcludeDominoDomainFromFwdAddrInAD=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.15.0

Determines if during mail routing, the Data Migration wizard skips the SMTP proxy address that includes the Domino domain when writing the AD proxy address values. When set to 0 (default), proxy addresses are written as usual. When set to 1, SMTP proxy addresses that include the Domino domain are skipped when writing the AD proxy address fields. Only the valid SMTP versions are written.

This parameter is only used when `SMTPForwardingAddress=0` and `CreateFwdAddrInAD=1`. For example:

When
```
SMTPForwardingAddress=0
CreateFwdAddrInAD=1
ExcludeDominoDomainFromFwdAddrInAD=1
```

Then
Domino forwarding address: `user@smtp.domain.com@DOMINODOMAIN`
and
AD proxyAddress: `smtp:user@smtp.domain.com`

When
```
SMTPForwardingAddress=0
CreateFwdAddrInAD=1
ExcludeDominoDomainFromFwdAddrInAD=0
```

Then
Domino forwarding address: `user@smtp.domain.com@DOMINODOMAIN`
and
AD proxyAddresses:
`smtp:user@smtp.domain.com`
`smtp:user@smtp.domain.com@DOMINODOMAIN`

[Notes] FindArchivesBy=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Specify how to find archives** radio-button choice in the *Specify How to Find Notes Archives* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support. Valid parameter values:

- **replica:** The wizard will look for archive replicas on the server.
- **scan:** The wizard will look for archives in file-system directories (to be specified later in the GUI).
- **admin:** The wizard will use the per-user values in the *ArchivePaths* column and/or *SharedArchiveDirs* column of the SQL Server database.

[Notes] FindMailFilesBy=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Specify how to find server mail files** radio-button choice in the *Specify How to Find Notes Mail Files* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change the value except at the direction of Quest Support. Valid values are:

- **nab:** The wizard will look for mail files on the server.
- **scan:** The wizard will look for mail files in file-system directories (to be specified later in the GUI).
- **admin:** The wizard will use the per-user values in the *MailFilePath* column of the SQL Server database.

[Notes] FindPABsBy=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Specify how to find Personal Address Books** radio-button choice in the *Specify How to Find Notes Personal Address Books* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support. Valid parameter values are:

- **replica:** The wizard will look for PAB replicas on the server.
- **scan:** The wizard will look for PABs in file-system directories (to be specified later in the GUI).
- **admin:** The wizard will use the per-user values in the *PABPaths* column and/or *SharedPABDirs* column of the SQL Server database.

[Notes] FixRtfExtraQuestionMark=<#>

Type:	Default:	Occurs in:	New in:
boolean	0 (off)	Data Migr	4.11

Determines whether the Data Migration Wizard will (1) or will not (0) use an alternate processing method to improve handling of certain foreign characters when migrating from Notes 7. The feature offers improved fidelity when migrating from some Notes 7 sources, but should be left disabled (default) unless you are experiencing garbled text with extraneous question marks in migrated Notes 7 messages containing foreign characters.

[Notes] ForceOldNxRTFdll=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines whether the Data Migration Wizard should use a pre-Notes 7 version of the *nxrtf2.dll* file, which the wizard uses to convert Notes rich text to MS RTF. The *nxrtf2.dll* file that accompanies Notes 7 and later provides better RTF fidelity during data extraction, but appears to be incompatible with some environments where it can cause the Notes environment to crash. This boolean parameter lets you force the migration program to use the older version of *nxrtf2.dll*:

> [Notes]
> ForceOldNxRTFdll=1

The feature is off (*ForceOldNxRTFdll=0*) by default, but is enabled by setting the parameter value to 1, as in the example above.

[Notes] ForwardingAddress=<value>

Occurs in: Data Migr. This is an internal scratch parameter (see Transient "scratch" parameters).

[Notes] ForwardingDomain=<DomainName>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the Forwarding mail domain text box in the *Specify Notes to Exchange Mail Forwarding* screen, and the Forwarding mail domain text box in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] FwdAddrDelim=<x>

Type:	Default:	Occurs in:
string	. [period character]	Data Migr

Specifies the character used to delimit the elements of Notes-to-Exchange forwarding addresses, when the Data Migration Wizard composes forwarding addresses. For example:

> FwdAddrDelim=,

... tells the wizard to use a comma to delimit the elements of the forwarding address. By default, the wizard uses a period as the delimiter.

[Notes] FwdAttrField=<ValidKeyword>

Type:	Default:	Occurs in:	New in:
keyword	TargetAddress	Data Migr	4.1

Specifies the method by which the Data Migration Wizard will compose forwarding addresses from Notes to Exchange. For example:

> FwdAttrField=SourceAddress

... specifies the *SourceAddress* method, as described below. By default the wizard uses the *TargetAddress* method, which also is the method used in pre-3.1 versions of Migrator for Notes to Exchange. The three valid parameter values are:

- *TargetAddress* (default): The left-hand side (LHS) of the *TargetAddress* column in the data table becomes the LHS of the forwarding address, to which the wizard appends the **Forwarding Domain** specified in the user interface during the program run.

- *SourceAddress:* The *SourceAddress* column in the data table becomes the left-hand side (LHS) of the forwarding address, to which the wizard appends the **Forwarding Domain** specified in the user interface during the program run.

- *ForwardingAddress:* The *ForwardingAddress* column in the data table becomes the forwarding address.

For the *TargetAddress* and *SourceAddress* options the delimiter character is usually a "dot" (period), but is configurable by the *FwdAddrDelim* parameter in this same [Notes] section.

[Notes] FwdCalDomain=<DomainName>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Set Calendar Domain** text box in the *Specify Notes to Exchange Mail Forwarding* screen, and the **New Calendar Domain** text box in the *Remove Existing Forwarding from Notes* screen. The administrator's entry in the *Specify Notes to Exchange Mail Forwarding* screen sets the default display in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] FwdMailDomain=<DomainName>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Set Mail Domain** text box in the *Specify Notes to Exchange Mail Forwarding* screen, and the **New Mail Domain** text box in the *Remove Existing Forwarding from Notes* screen. The administrator's entry in the *Specify Notes to Exchange Mail Forwarding* screen sets the default display in the *Remove Existing Forwarding from Notes* screen. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] IgnoreACLs=<ACL_Member>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.1

The Data Migration Wizard seeks to validate ACL entries by matching each with a corresponding ACL entry in Exchange. Use this parameter to specify one or more ACL member entries that the Data Migration Wizard should ignore.

This parameter can be used to perform the following tasks.

- For a user that is valid on both Notes and Exchange, prevent permissions from being granted for that user in Exchange. Specifying the user in the `IgnoreACLs` parameter suppresses the migration of permissions.

- For a user that is only valid on Notes, prevent multiple Warning messages in the migration log file.

    The wizard creates a Warning in its log file if no corresponding Exchange entry is found. If a particular ACL member entry triggers the Warning, and if the same entry occurs in many of the source ACLs, the Warnings proliferate and swell the log file, making it difficult to read and navigate. Specifying the user in the `IgnoreACLs` parameter suppresses the Warnings.

To set the parameter, specify the ACL member. For example:

    IgnoreACLs=Administrator

... tells the wizard to ignore ACL member entries of *Administrator*. You can specify two or more values by separating them with commas. There is no default value for this parameter, but the Setup program automatically enters the following values upon installation:

    IgnoreACLs=LocalDomainServers,OtherDomainServers

[Notes] IgnoreForms=<FormName>

Type:	Default:	Occurs in:	New in:
string	H_PAGEUI	Data Migr	4.1.5

Specifies one or more particular forms for the Data Migration Wizard to ignore (not migrate). For example:

IgnoreForms=H_PAGEUI

... tells the program to not migrate H_PAGEUI forms.

This parameter can also be used to force the program to ignore forms that are ordinarily processed, by preceding the form name with an exclamation point (i.e., IgnoreForms=!FormName).

[Notes] JournalEntryForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
keyword	Activity	Data Migr	4.1.5

Permits the designation of alternate names for journal entry forms to migrate. For example:

```
JournalEntryForms=journal
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
JournalEntryForms=journal|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] JournalEntryMessageType=<keyword>

Type:	Default:	Occurs in:	New in:
keyword	Activity	Data Migr	4.1.5

Determines whether each Notes JournalEntry and CleanSheet item should be migrated to Exchange as an *Activity* (default) or a *StickyNote*. For example:

JournalEntryMessageType=StickyNote

… tells the wizard to migrate these items as StickyNotes. Note that the Migrator for Notes to Exchange parameter value must appear in singular (not plural) form: *Activity* or *StickyNote*.

[Notes] LocateArchives=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Archives** check box (under *Data to locate*) in the *Select Notes Data Store Type(s) to Locate* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] LocateMailFiles=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Mail files** check box (under *Data to locate*) in the *Select Notes Data Store Type(s) to Locate* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] LocateNew=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the Find new data stores... radio-button option (under Operations to perform) in the Select Notes Data Store Type(s) to Locate screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] LocatePABs=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Personal Address Books** check box (under *Data to locate*) in the *Select Notes Data Store Type(s) to Locate* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] LookupDisplayNames=<#>

Type:	Default:	Occurs in:
boolean	0	Data Loc, Data Migr

When the archive owner's or a contact's full address cannot be found in the address translation table, this parameter determines if the Data Migration Wizard and the Notes Data Locator Wizard will instead try to find a corresponding object by just the display name portion of the full address.

This feature is disabled by default (*LookupDisplayNames=0*), because it carries some risk of an incorrect match— i.e., if more than one user shares the same name. To enable the feature, set *LookupDisplayNames=1*, and the wizard will try the display name lookup if its full-address lookup does not return a match.

[Notes] MailAndCalQueryFilter=<NotesQueryString>

Type:	Default:	Occurs in:	New in:
string	[null]	Data Migr	4.12

Specifies a migration filter for mail and calendar items, in the form of a Notes query to limit the data pulled from the migrating NSFs. The *<String>* value must take the form of a Notes query, for example:

    MailAndCalQueryFilter=SELECT $Revisions >= @Date(2014;09;01)

This example would limit the mail and calendar items extracted for migration to only those that have been modified since 09/01/2014. The default (*null*, or if the parameter is omitted) simply lets the migration proceed unfiltered for mail and calendar items. Another parameter in this [Notes] section, *PabQueryFilter*, permits migration filtering for address books, also by a Notes query.

[Notes] MailDesignClass=<DesignClassName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

> MailDesignClass=class2

... tells the Data Migration Wizard to recognize *class2* as an additional design class (in addition to the default design class) for Mail NSF files. If the wizard finds an NSF file that does not match any of the wizard's default design classes for Archive, Mail or PAB files, the wizard will look at this parameter (and the comparable *ArchiveDesignClass* and *PABDesignClass* parameters) to find an alternate design class, and thereby determine the file type. To designate more than one additional design class for Mail files, use the pipe character (|) to separate between each pair of class names, like this: *MailDesignClass=class2|class3|class4*

[Notes] MailFileDir=<DirectorySpecification>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Mail file directories** box in the *Specify Notes Mail File Directories* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

One or more directories may be specified within the single parameter value. To define more than one, use a pipe character (|) to separate each pair. Example:

> MailFileDir=\\folder\data\mail1 | \\folder\data\mail2 | \\folder\data\mail3 | ...

[Notes] MailSystem=<#>

Type:	Default:	Occurs in:	New in:
keyword	[GUI entry]	Data Migr	4.1

This value corresponds to two GUI elements in the Data Migration Wizard, the **Set MailSystem** drop-down list box in the *Specify Notes to Exchange Mail Forwarding* screen, and the **Set MailSystem** drop-down list box in the *Remove Existing Forwarding from Notes* screen. The administrator's entry in the *Specify Notes to Exchange Mail Forwarding* screen sets the default display in the *Remove Existing Forwarding from Notes* screen. The parameter value tells the wizard whether the Notes Mail System will be set to Notes (1), Other (3), or Other Internet Mail (5). The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support. Any manual manipulation of this parameter value is meaningless and will have no affect on the program or data, since any preexisting parameter values are overwritten by the program.

[Notes] MapDefaultAclToReviewer=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.5.4

Determines (in conjunction with the parameter *[Notes] ElevateCalendarAuthorACLtoEditor*) how the wizard maps some Notes access levels to Exchange, for calendar and to-do items. Specifically, the *No Access* and the *Depositor* access levels are mapped as shown in the following table, for selected *Read Public* and *Write Public* Notes permissions.

Read Public	Write Public	Migrator for Notes to Exchange **Parameter Settings** (defaults are shown here in red)	Exchange Calendar / ToDo Access Rights
No	[— — — — — — — any combination — — — — — — —]		No Access
Yes	No	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=1	Reviewer
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0 or 1	Reviewer
	Yes	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 or 1 ElevateCalendarAuthorACLtoEditor=1	Editor
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0	Author

[Notes] MapPrivateAsPublic=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines whether the Data Migration Wizard will mark as "Public" a non-mail message whose Notes *$PublicAccess* attribute is not set. For example:

        MapPrivateAsPublic=1

... tells the wizard to mark a non-mail-type message as "Public" if its *$PublicAccess* attribute is not set. By default (*MapPrivateAsPublic=0*), the wizard will leave such messages marked as "Private."

[Notes] MemoForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Permits the designation of alternate names for mail forms to migrate. For example:

        MemoForms=memo

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

        MemoForms=memo|another name|...

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] MigrateAppointmentResponses=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

Determines whether the Data Migration Wizard will migrate responses to appointment/meeting requests (*Accepted*, *Declined*, etc.). For example:

MigrateAppointmentResponses=1

... tells the wizard to migrate responses. Setting this parameter (and *MigrateReservationsAlways* below) to 1 may be necessary if the Domino calendar data uses a custom template, since occasionally in this scenario (mostly with recurring meetings) not all calendar reservations are migrated.

For example: Migrator for Notes to Exchange's migration of appointments assumes invited resources are derived from the standard Notes resource-reservation template, or a customized variation of it that conforms to certain standard elements. Migrator for Notes to Exchange may not recognize resource reservations derived from more heavily customized templates, and in this case, or where no template is used at all, the migration may introduce resource reservation errors. To prevent such errors, try setting:

[Notes]
MigrateAppointmentResponses=1
MigrateReservationsAlways=1

[Notes] MigrateConflictDocs=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.1.0

Tells the Data Migration Wizard whether to migrate replication conflicts. By default (*MigrateConflictDocs=0*), conflict documents will not be migrated. But:

MigrateConflictDocs=1

... tells the wizard to migrate conflict documents to the *All Documents* folder.

[Notes] MigrateDBDirectReservations=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

When set to the default value (1), MNE migrates room bookings made directly to the resource reservation database. When set to (0), these bookings are skipped.

[Notes] MigrateEmptyFolders=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

MigrateEmptyFolders=0

... tells the Data Migration Wizard to not migrate empty folders. By default, the wizard will migrate all folders regardless of whether they contain any items.

[Notes] MigrateMailUsingServer=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Through Domino server(s)** vs. **Through the filesystem** radio buttons in the *Notes Mail Files* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry: *MigrateMailUsingServer=0* if the filesystem option is selected, or *MigrateMailUsingServer=1* for the Domino server(s) option. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] MigrateOrphanedDocs=<#>

Type:	Default:	Occurs in:
boolean	1	Data Migr

Tells the Data Migration Wizard whether to migrate "orphaned" documents that appear only in the Notes All Documents folder. Orphaned documents are migrated by default, to an All Documents folder in Exchange, but this feature can be disabled (orphaned documents will not be migrated) by setting this parameter to zero:

        MigrateOrphanedDocs=0

[Notes] MigrateReservationsAlways=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines whether the Data Migration Wizard will treat migrating NSFs as reservations databases regardless of the design class. For example:

        MigrateReservationsAlways=1

... forces the wizard to treat migrating NSFs as reservations databases. The wizard does not treat an NSF as a reservation database by default (0). Setting this parameter (and *MigrateAppointmentResponses* above) to 1 may be necessary if the Domino calendar data uses a custom template, since sometimes in this scenario (mostly with recurring meetings) not all calendar reservations are migrate.

For example: Migrator for Notes to Exchange's migration of appointments assumes invited resources are derived from the standard Notes resource-reservation template, or a customized variation of it that conforms to certain standard elements. Migrator for Notes to Exchange may not recognize resource reservations derived from more heavily customized templates, and in this case, or where no template is used at all, the migration may introduce resource reservation errors. To prevent such errors, try setting:

        [Notes]
        MigrateAppointmentResponses=1
        MigrateReservationsAlways=1

> **!** **CAUTION:** This parameter should be enabled only when migrating resource reservations. Other uses may cause calendar items to be incorrectly migrated to mailboxes instead of to Outlook calendars.

If not all objects in the collection are classified as resources, but *MigrateReservationsAlways=1*, the wizard presents a popup warning explaining that the calendars of non-resource objects may not migrate correctly and suggesting that *MigrateReservationsAlways* be disabled (set to 0) unless the admin is certain that all objects in the collection are resources. (The popup offers the option of ignoring a *MigrateReservationsAlways=1* setting.)

[Notes] MimeIgnoreBoundryWhitespace=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.9

Determines whether the Data Migration Wizard will be configured to not ignore MIME data that is preceded by a boundary of whitespace and/or null characters. For example:

> MimeIgnoreBoundryWhitespace=1

... tells the wizard to not ignore MIME data that is preceded by a boundary of whitespace and/or null characters. The feature is off (0) by default.

[Notes] NAB<#>=<FullPathAndFilename>

Type:	Default:	Occurs in:
string	[none]	NABs Disc, Data Migr

Each *NAB<#>* parameter specifies the full path and filename of a Personal Address Book to be migrated. One or more *NAB<#>* parameters may be defined to specify one or multiple NABs to migrate. For example:

> [Notes]
> NAB0=\\server\folder\filename0.nsf
> NAB1=\\server\folder\filename1.nsf
> NAB2=\\server\folder\filename2.nsf

The digit(s) appended to a *NAB<#>* key name differentiate one parameter from another. Multiple *NAB<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. But the wizard will read only *NAB<#>* parameters whose differentiating digits are less than a value specified by a *NABCount* parameter in the first line of the same section. See the *NABCount* parameter below for more information.

[Notes] NABCount=<#>

Type:	Default:	Occurs in:
integer	0	NABs Disc, Data Migr

A limit to the number of *NAB<#>* parameters (see above) that the Data Migration Wizard will process in this section. The wizard will read only *NAB<#>* parameters whose differentiating digits are less than the *NABCount* value specified here. For example, if:

> [Notes]
> NABCount=5
> NAB0=\\server\folder\filename0.nsf
> NAB1=\\server\folder\filename1.nsf
> NAB2=\\server\folder\filename2.nsf
> NAB3=\\server\folder\filename3.nsf
> NAB4=\\server\folder\filename4.nsf
> NAB5=\\server\folder\filename5.nsf
> NAB6=\\server\folder\filename6.nsf

... the wizard will read all the parameters except *NAB5* and *NAB6*, since *NABCount=5*, and neither 5 nor 6 is less than 5.

If unspecified, the *NABCount* parameter defaults to 0. If specified, the parameter must occur as the first line of the section, as shown above.

[Notes] NabReaderGroup=<AlphanumString>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Group used to hide...** text box in the *Notes User Visibility* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] NeedLoginInfo=<#>

Type:	Default:	Occurs in:
boolean	[derived from SQL Server database]	Data Migr

Determines whether the Data Migration Wizard will prompt for Notes login credentials. For example: *NeedLoginInfo=1* tells the wizard to display its *Specify Notes Login Information* screen during its run, to collect necessary Notes access credentials. The Data Migration Wizard automatically derives this value from admin entries in the *Notes Server Configuration* screen of Notes Migration Manager, and writes the value to the wizard's Task Parameters; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] NotesFormatPreference=<#>

Type:	Default:	Occurs in:	New in:
keyword	[GUI entry]	Data Migr	4.1.5

This value corresponds to two GUI elements in the Data Migration Wizard, which tell the wizard how to set the Notes Format preference for incoming mail setting. (The parameter is used only when setting or removing Notes mail forwarding.) The parameter value is a single-digit integer keyword that tells the wizard which of three options to set for the Notes setting:

> 0: Prefers Notes Rich Text
> 1: Keep senders' format
> 2: Prefers MIME

The wizard writes this single-digit value to the Task Parameters according to an admin's GUI entry in either screen:

- In the *Specify Mail Routing Screen*: The **Using ActiveMail processing** check box tells the wizard whether to set the Notes parameter to *Keep senders' format* (if the check box is marked), or *Prefers MIME* (unmarked). The *Prefers Notes Rich Text* option is not available from this screen.

- In the *Specify Remove Notes Forwarding Settings* screen: The **Set format preference** drop-down list box offers a choice of any of the three settings cited above.

Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] NotesIniPath=<PathAndFilename>

Type:	Default:	Occurs in:
string	[inferred from operating environment]	Data Migr

Specifies the location of the *notes.ini* file. This value is inferred from the operating environment and automatically written to the Global Defaults; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] NotesPreferredNAB=<NABSpec>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.4.2

Specifies the NAB used for Notes Administrative Functions, for improved control over Domino directory updates. The parameter value is a combination of the Domino server name and file name. For example:

NotesPreferredNAB= Dom1/quest!!names.nsf

The specific syntax can be found on the *Find NABs* screen within Notes Migration Manager.

[Notes] NoticeForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Permits the designation of alternate names for appointment notice forms to migrate. For example:

```
NoticeForms=notice
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
NoticeForms=notice|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] Offline=<#>

Type:	Default:	Occurs in:
boolean	0	Dir Exp

Determines whether the wizard will (1) or will not (0) disable Notes catalog searches when extracting data from the NAB. This parameter can be useful to avoid timeouts, "server not available" errors, and "access denied" errors while trying to open the catalogs on all the servers that host users' mail files. *Offline=1* is therefore appropriate when running a Directory Export in an environment that does not have access to the other servers—for example, where a local copy of the NAB is being used on a test machine instead of using the live NAB on a production machine. Another example would be where the wizard is running with a *user.id* file that has no rights to all the other servers. By default (0), catalog searches are enabled as part of the data extraction.

[Notes] OrphanedDocsFolder=<Folder Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.0.0

Sets the name of the "All Documents" folder in Exchange, which receives orphaned documents from Notes' "All Documents" folder. The folder is named "All Documents" by default, but you can assign any other valid name. For example: *OrphanedDocsFolder=Orphans*

[Notes] OverridePabInternetAddress

Type:	Default:	Occurs in:	New in:
keyword (single digit 0,1, or 2)	1	Data Migr	4.14.1

When migrating each Personal Address Book entry, the organization's Directory is searched for a matching user or contact. If a match is found, the personal contact's primary email address is replaced with the primary target address (i.e., the SMTP address) of the matching entity from the directory. This is appropriate if the email address in the PAB contact has a Notes style address, but it may not be appropriate if the email address in the PAB contact has an SMTP style address.

• To instruct MNE to not override SMTP style addresses of PAB contacts, set this parameter to 2.

• To instruct MNE to not override any address of PAB contacts, set this parameter to 0.

[Notes] OwnerByACL=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the Examine ACLs to determine owner check box in the *Specify How to Determine Owner Using ACL* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PABDesignClass=<DesignClassName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

    PABDesignClass=class2

... tells the Data Migration Wizard to recognize *class2* as an additional design class (in addition to the default design class) for PAB NSF files. If the wizard finds an NSF file that does not match any of its default design classes for Archive, Mail or PAB files, the wizard will look at this parameter (and the comparable *ArchiveDesignClass* and *MailDesignClass* parameters) to find an alternate design class, and thereby determine the file type. To designate more than one additional design class for PAB files, use the pipe character (|) to separate between each pair of class names, like this:

    PABDesignClass=class2|class3|class4

[Notes] PabDir=<DirectorySpecification>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Root directories** box in the *Specify Notes Personal Address Book Directories* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually change this value except at the direction of Quest Support. One or more directories may be specified within the single parameter value. To define more than one, use a pipe character (|) to separate each pair. For example:

    PabDir=\\folder\data\pab1 | \\folder\data\pab2 | \\folder\data\pab3 | ...

[Notes] PabGroupForms=<form type>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Tells the Data Migration Wizard whether and how to migrate personal address book (PAB) form types that are not of the standard *Group* form type. For example, to migrate PAB Group form type *Business Card*, you would enter: *PabGroupForms=Business Card*

By default (if this parameter is omitted) the wizard will not migrate PAB form types that are not of the standard form type.

[Notes] PabPersonForms=<form type>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Tells the Data Migration Wizard whether and how to migrate personal address book (PAB) form types that are not of the standard *Person* form type. For example, to migrate PAB Person form type *Business Card*, you would enter: *PabPersonForms=Business Card*

By default (if this parameter is omitted) the wizard will not migrate non-standard PAB form types.

[Notes] PabQueryFilter=<NotesQueryString>

Type:	Default:	Occurs in:	New in:
string	[null]	Data Migr	4.12

Specifies a migration filter for address books in the form of a Notes query, to limit the data pulled from the migrating NSFs. The <String> value must take the form of a Notes query, for example:

    PabQueryFilter=SELECT $Revisions >= @Date(2014;09;01)

This example would limit the PABs extracted for migration to only those that have been modified since 09/01/2014. The default (*null*, or if the parameter is omitted) simply lets the migration proceed unfiltered for PABs. Another parameter in this [Notes] section, *MailAndCalQueryFilter*, permits migration filtering for mail/calendar items, also by a Notes query.

[Notes] PABReplicaDir=<Directory>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Directory** text box in the *Specify Notes Personal Address Book Replica Directory* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PABReplicaServer=<Server>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Server** text box in the *Specify Notes Personal Address Book Replica Directory* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PabReplicatorFrom=<AlphanumString>

Type:	Default:	Occurs in:
string	[GUI entry]	PAB Replic

This value corresponds to a GUI element in the Send PAB Replicator Wizard, the **From** text box in the *Replicator Information* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PabReplicatorSubject=<AlphanumString>

Type:	Default:	Occurs in:
string	[GUI entry]	PAB Replic

This value corresponds to a GUI element in the Send PAB Replicator Wizard, the **Subject** text box in the *Replicator Information* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PabReplicatorTargetDir=<DirectoryName>

Type:	Default:	Occurs in:
string	[GUI entry]	PAB Replic

This value corresponds to a GUI element in the Send PAB Replicator Wizard, the **Directory** text box in the *Replicator Information* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PabReplicatorTargetServer=<value>

Type:	Default:	Occurs in:
string	[GUI entry]	PAB Replic

This value corresponds to a GUI element in the Send PAB Replicator Wizard, the **Server** text box in the *Replicator Information* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PabReplicatorTemplate=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	PabReplicator	PAB Replic

This value corresponds to a GUI element in the Send PAB Replicator Wizard, the Template drop-down list box in the *Replicator Information* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PABRequiredAttrs=<Attrib1>|<Attrib2>|<Attrib3>|...

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2.0

Defines a list of address-book attributes, from which at least one must be present within a PAB for the PAB to be migrated. The *<Attrib#>* variables stand for the names of address-book attributes in the Notes/Domino source. Each pair of attribute names must be separated by a pipe character (|). For example:

    PABRequiredAttrs=ListName|LastName|CompanyName

... tells the wizard to migrate a PAB only if it contains at least one of the attributes *ListName* or *LastName* or *CompanyName*. This feature is also an option in the SSDM (same parameter, but in *notesdtapp.ini*).

[Notes] PabsInMailFile=<value>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate contacts from iNotes store** check box (under Migrate mail data) in the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] Password=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, Dir Exp, Data Loc, NABs Disc, Doms Disc, Data Migr, PAB Replic

This value corresponds to a GUI element in the Notes Migration Manager: the **Password** text box in the *Notes Server Configuration* screen. Migrator for Notes to Exchange writes this value to the Task Parameters based on an admin's GUI entry. The parameter value here is obfuscated, for security, and Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] PrependSmtpAddressToUserName=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1, 2 or 3)	0	Data Migr	4.5.4

Determines what (if anything) Migrator for Notes to Exchange's Data Migration Wizard will do with the **Notes user name** field when **Manage mail routing** is selected.

> **i** | **NOTE:** This parameter has been updated as of release 4.15.1 Hotfix 9.
>
> When enabled, this parameter applies when the coexistence method is either **Quest Coexistence Manager for Notes** or **SMTP**.

The parameter accepts any of four valid single-digit settings:

>   0 (default): Do nothing with the Notes user name field.
>   1: prepend: Insert SMTP address at top of user name field.
>   2: append: Insert SMTP address at bottom of user name field.
>   3: Insert SMTP address as the second address in the user name field.

Quest's CMN Free/Busy Connector requires the SMTP address in the user name field, either at the top of the field (*PrependSmtpAddressToUserName=1*) or at the bottom (2), depending on the selected mail-routing method.

[Notes] ProcessContactInternetAddress=<#>

Type:	Default:	Occurs in:	New in:
keyword (single digit 0, 1 or 2)	0	Data Migr	4.6.0.66

Determines how Migrator for Notes to Exchange will use the Internet Address value in a Notes contact — whether the Notes *InternetAddress* value will be used as the primary or secondary Email address, or not used at all:

			Internet Address is assigned to:	MailAddress is assigned to:
[Notes] ProcessContactInternetAddress=<#>	0:		nothing (is ignored)	*Email* (primary)
	1:		*Email2* (secondary)	*Email* (primary)
	2:		*Email* (primary)	*Email2* (secondary)

[Notes] ProcessWMFImages=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.5.1

Determines whether the Data Migration Wizard will apply an additional layer of processing to embedded images, so the images appear correctly in Outlook. This new feature became the new default behavior upon its introduction in ver 4.5.1. You can disable the feature by setting *ProcessWMFImages=0*.

[Notes] QuotaMode=<ValidKeyword>

Type:	Default:	Occurs in:
keyword (*never*, *once* or *always*)	once	Data Loc

Determines whether the Data Locator Wizard will retrieve mail file quota data. This is a multiple-choice parameter with three valid values:

- **never:** never retrieve mail file quota data.
- **once:** only the first time the wizard runs.
- **always:** every time the wizard runs.

For example: *QuotaMode=never* tells the wizard to never retrieve the quota data. To retrieve quota data the wizard must open each mail file, which can dramatically slow performance.

[Notes] RecipientBccWords

Type:	Default:	Occurs in:	New in:
string	bcc|Blindkopie	Data Migr	4.16.1

This parameter takes effect only if the parameter for migrating RTF to HTML ([Exchange] MigrateRtfToHtml) is enabled. There is an issue in the Notes built-in HTML APIs used by MNE to convert Notes RTF to HTML. The header information such as To, cc, bcc is constructed as a table and is incorrectly inserted into the message body after migration. Use this parameter associated with [Notes] RecipientCcWords and [Notes] RecipientToWords so that MNE will search for the table and remove it from the migrated HTML.

The default value supports English, French, German and Japanese.

[Notes] RecipientCcWords

Type:	Default:	Occurs in:	New in:
string	cc|Kopie	Data Migr	4.16.1

This parameter takes effect only if the parameter for migrating RTF to HTML ([Exchange] MigrateRtfToHtml) is enabled. There is an issue in the Notes built-in HTML APIs used by MNE to convert Notes RTF to HTML. The header information such as To, cc, bcc is constructed as a table and is incorrectly inserted into the message body after migration. Use this parameter associated with [Notes] RecipientBccWords and [Notes] RecipientToWords so that MNE will search for the table and remove it from the migrated HTML.

The default value supports English, French, German and Japanese.

[Notes] RecipientToWords

Type:	Default:	Occurs in:	New in:
string	to|An|A| 宛先	Data Migr	4.16.1

This parameter takes effect only if the parameter for migrating RTF to HTML ([Exchange] MigrateRtfToHtml) is enabled. There is an issue in the Notes built-in HTML APIs used by MNE to convert Notes RTF to HTML. The header information such as To, cc, bcc is constructed as a table and is incorrectly inserted into the message body after migration. Use this parameter associated with [Notes] RecipientBccWords and [Notes] RecipienCcWords so that MNE will search for the table and remove it from the migrated HTML.

The default value supports English, French, German and Japanese.

[Notes] ReplaceForwardAddressInUserName=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.15.1

Determines if MNE replaces or adds the Forward address in the **User Name** field.

By default, MNE replaces the Forward address in the **User Name** field. When `ReplaceForwardAddressInUserName` is set to (0), MNE adds the Forward address to the **User Name** field without removing the existing address.

> **i** | **NOTE:** If you want to add the Forward address to the **User Name** field by setting `ReplaceForwardAddressInUserName=0`, the parameter `[Notes] PrependSmtpAddressToUserName` cannot be set to 0 (the default value).

[Notes] ReservationForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Permits the designation of alternate names for appointment or resource reservation forms to migrate. For example:

```
ReservationForms=reservation
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
ReservationForms=reservation|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] RewriteDocLinks=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	3.2

When set to the default value (1), MNE scans Notes files for document links in the RTF message body and rewrites the links as HTML-style links. To disable the parameter, set the value to 0.

Setting the parameter to 0 is equivalent to setting:

- `[General]HTMLDocLinks=0`

- `[Exchange]ExtractEmbeddedImage=0`

[Notes] Server=<ServerSpecification>

Type:	Default:	Occurs in:
string	[none]	NMM, Dir Exp, NABs Disc, Data Migr, PAB Replic

This value corresponds to a GUI element in the Notes Migration Manager: the **Server** text box in the *Notes Server Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] SetPersonDocCustom=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

This value corresponds to a GUI element in the Data Migration Wizard, the **Set Person Document Attributes** check box in the *Select Notes Administrative Operations* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] SkipCompletedTasks=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.5

Determines whether the wizard will skip or migrate tasks that are complete in the Notes source. For example:

    SkipCompletedTasks=1

… tells the wizard to skip (not migrate) Notes tasks that are marked as complete. The feature is off (*SkipCompletedTasks=0*) by default.

[Notes] SkipConflictDocs=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Dir Exp	4.1.4

Determines whether the Directory Export Wizard will ignore replication conflict documents that occur within a source NAB. For example:

    SkipConflictDocs=1

... tells the wizard to ignore replication conflict documents. This feature is on (1) by default, but can be disabled by *SkipConflictDocs=0*. Before this feature was added, the wizard exported a conflict document and its corresponding original as separate objects with the same SMTP address.

[Notes] SkipInternetHeaders=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.13.0.78

Determines if message internet headers are migrated. By default, message internet headers are not skipped. When internet headers are migrated, all internet header information and the header is migrated.

If SkipInternetHeaders is set to On (1), none of the message internet headers are migrated.

[Notes] SkipNotes=<MsgIDHexString>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.1

Specifies one or more messages that the Data Migration Wizard should skip when migrating data, typically used to bypass the rare message that contains some problematic element, such as corrupted data, that the wizard cannot process. When a wizard run is abandoned by a "bad" message, the run log reports the message ID (an arbitrary hex string generated by the wizard) near the end of the log, for example: *notesID 0X00001FFA*. An administrator can exclude that message using this parameter setting:

        SkipNotes=0X00001FFA

... so the wizard ignores that message the next time it runs. In the event a single wizard run should encounter two or more problematic messages, you can use this parameter to specify multiple message IDs separated by commas:

        SkipNotes=0X00001FFA,0xC2A

[Notes] SMTPForwardingAddress=<#>

Type:	Default:	Occurs in:	New in:
boolean	1 for CMN coexistence; otherwise 0	Data Migr	4.1.5

Determines whether the wizard, in mail routing, will omit the second "@XXXX" element from the Domino forwarding address and AD proxyAddress values:

If *SMTPForwardingAddress=0*:	If *SMTPForwardingAddress=1*:
user@smtp.domain.com@DOMINODOMAIN smtp:user@smtp.domain.com@DOMINODOMAIN	user@smtp.domain.com smtp:user@smtp.domain.com

Even with *SMTPForwardingAddress=1*, the admin must still enter some value for the Domino domain on the *Set Notes Forwarding* screen, to enable the **Next** button—although the value entered will not be used in the migration.

[Notes] SourceAdminDirSync=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

Determines how the wizard will set the *Foreign Directory Synchronization* field of the Notes person document—used only if **Notes Administrative Functions** has been selected (if *DoSourceAdmin=1*), and **Set foreign directory sync** has also been selected (*DisableDirsync=1*). For example:

        SourceAdminDirSync=1

… tells the wizard to set the Notes *Foreign Directory Synchronization* field to *Yes*, while a value of 0 (the default) tells the wizard to set the field to *No*.

[Notes] StandardAndUserFoldersOnly=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.15

When this option is enabled, folders and views whose names are surrounded by brackets are flagged as system objects. System views and folders (with the exception of a specific set of standard system views and folders) will not be migrated. With this option enabled, a typical migration will include the following views and folders:

• ($Inbox)

• ($Sent)

- ($Drafts)

- ($Trash)

- ($JunkMail)

- (Stationery)

- All user views and folders (identified as views and folders whose names are NOT surrounded by brackets)

- ($All) (only when orphaned messages are migrated as per the `[Notes] MigrateOrphanedDocs` setting)

- Any other views and folders listed in the [IncludeFoldersAndViews] section

Setting `StandardAndUserFoldersOnly` to 0 allows both system and user folders/views to be migrated. Note that this requires configuring the [Filters] section with the itemized list of folders and views that should not be included in the migration.

[Notes] StationeryFolder=<FolderName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Specifies the name of the Notes folder that contains Notes stationery. Example:

> StationeryFolder=Letterhead

Usually the wizard can automatically determine the source location of Notes stationery, but in some cases the folder must be specified by this parameter.

[Notes] StationeryForms=<FullPathAndFilename>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Specifies one or more custom-designed Notes stationery forms to migrate. The parameter value consists of a form filename, which may end with an asterisk (*) for simple wildcard matching. You may specify multiple filenames by using a pipe character (|) to separate each pair. For example:

> StationeryForms=filename1 | filename2 | filename3

[Notes] TaskForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Permits the designation of alternate names for task forms to migrate. For example:

> `TaskForms=task`

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

> `TaskForms=task|another name|...`

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] TaskNoticeForms=<Alternate Name>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.1.0

Permits the designation of alternate names for task notice forms to migrate. For example:

```
TaskNoticeForms=tasknotice
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
TaskNoticeForms=tasknotice|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] UpdateMode=<ValidKeyword>

Type:	Default:	Occurs in:
keyword (*append*, *replaceLoc* or *replaceAll*)	[GUI entry]	Data Loc

This value corresponds to a GUI element in the Data Locator Wizard, the **Add/ Replace** mode drop-down list box (under **Operations to perform**) in the *Select Notes Data Store Type(s) to Locate* screen. The wizard writes this value to the Task Parameters from the GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support. Valid parameter values are:

- **append:** The wizard will add new data found at the designated locations to any previously found data from the same locations.

- **replaceLoc:** The wizard will replace any data previously found at the designated locations with any new data found at the same locations.

- **replaceAll:** The wizard will replace all data previously found at all locations with the data found in this run of the wizard.

[Notes] UpdateRtfFonts=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.1.4

Determines whether the wizard will automatically replace the Microsoft generic serif, sans-serif and Courier fonts in RTF message bodies with, respectively, Times New Roman, Arial and Courier New fonts. For example:

```
UpdateRtfFonts=0
```

... tells the wizard to not make those replacements. This option is on by default (*UpdateRtfFonts=1*).

[Notes] UseCanonicalForwardingServerName=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines how the Data Migration Wizard will format the MailServer attribute in the Notes Person Document when configuring Notes-to-Exchange forwarding. For example:

```
Use CanonicalForwardingServerName=1
```

... tells the wizard to write the attribute in canonical format (*CN=ServerName/ O=DomainName*), which is suitable for mail routing via Microsoft Transport Suite or CMN, but not via SMTP. By default (*UseCanonicalForwardingServerName=0*) the attribute is set in flat format: *ServerName/DomainName*.

[Notes] UseIMAPFlags=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

    UseIMAPFlags=1

... tells the wizard to check bit 0 of the *$FolderRefFlags* Notes attribute to determine whether messages are read or unread. The bit is set to 0 if an item is unread, or set to 1 if the item has been read.

[Notes] UseLegacyMeetingParentHeuristic=<#>

Type:	Default:	Occurs in:	New In:
boolean	1	Data Migr	4.12

Specifies the method the Data Migration Wizard will use to process a complex recurring meeting series where the series parent is difficult to identify. For example:

    UseLegacyMeetingParentHeuristic=0

... tells the wizard to apply an alternate method that is better suited to such complex series. By default (1) MNE uses the previous method, which is better suited to environments migrating no (or few) such series.

[Notes] UseMailFileOwner=<#>

Type:	Default:	Occurs in:
boolean	1	Data Loc

Tells the Data Migration Wizard whether to check mail file ownership by checking either the ACL or the document profile (the method is specified during the program run). By default (*UseMailFileOwner=1*), the wizard identifies mail files by combining the designated server path with the corresponding (per-user) mailfile values in the SQL Server database, and checks either the ACL or document profile to verify ownership. But when ...

    UseMailFileOwner=0

... the wizard does not check the ownership of the NSF file.

[Notes] UseNotes=<value>

Occurs in: Dir Exp. This is an internal scratch parameter (see Transient "scratch" parameters).

[Notes] UserFolderPrefix=<FolderName>

Type:	Default:	Occurs in:	New in:
string	Folders	Data Migr	4.1

Specifies the name of an Outlook folder to which all user-created Notes folders will be migrated (as subfolders). For example: *UserFolderPrefix=MyFolders* tells the Data Migration Wizard to create a folder named *MyFolders* in the Outlook root directory (at the same level as the Inbox), and copy all user-created Notes folders to the new *MyFolders* folder in Outlook. The default value is *Folders.* See also Custom folder mapping on page 13 for more information about this *UserFolderPrefix* parameter, and how its value affects custom-folder mapping parameters in the language sections of Migrator for Notes to Exchange parameters.

> **i** | **NOTE:** Setting the value to an empty string results in the custom folders being created at the same level as the Inbox folder.

[Notes] UserIdFile=<AlphanumString>

Type:	Default:	Occurs in:
string	[none]	NMM, Dir Exp, Data Loc, NABs Disc, Doms Disc, Data Migr, PAB Replic

This value corresponds to a GUI element in the Notes Migration Manager: the **User ID file** text box in the *Notes Server Configuration* screen. The program writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] UserViewPrefix=<FolderName>

Type:	Default:	Occurs in:	New in:
string	Views	Data Migr	4.15

Specifies the name of an Outlook folder where all user-created Notes views are migrated to (as subfolders).

For example: `UserViewPrefix=MyViews` tells the Data Migration Wizard to create a folder named `MyViews` in the Outlook root directory (at the same level as the Inbox), and copy all user-created Notes views to the new `MyViews` folder in Outlook. The default value is `Views`.

> ℹ️ **NOTE:** Views do not exist in Exchange. A Notes view is migrated to Exchange as a folder.

> ℹ️ **NOTE:** Setting the value to an empty string results in the custom folders being created at the same level as the Inbox folder.

[Notes] ValidateDatabasePermissions=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines whether the Data Migration Wizard will verify access permissions for the NSF files in the designated collection. For example:

    ValidateDatabasePermissions=1

… tells the wizard to verify NSF permissions for the userid specified on the wizard's *Notes Server* screen. By default (0) the wizard will not check NSF permissions.

[Notes] ViewAndFolderFlagPattern=<string>

Type:	Default:	Occurs in:	New in
string	-G40^n	Data Migr	4.15

The `ViewAndFolderFlagPattern` value is used to identify those Notes design elements of the VIEW class that should be classified as Views or Folders. Only the design elements whose design flags match the specified pattern are migrated. All other design elements will be ignored. This prevents the migration of design elements that belong to the VIEW class, but are not in fact views or folders. For example this pattern prevents the migration of shared columns.

The specified pattern must follow the syntax specified by the Notes API under Design Flag Patterns. The specific flags and their meanings can be obtained from the Notes API in the file `stdnames.h`. This header file also includes a list of patterns for identifying specific types of design elements. The default pattern used above comes from the pattern `DFLAGPAT_VIEWS_AND_FOLDERS` in `stdnames.h`.

This parameter is considered an extremely advanced setting, and should only be modified at the direction of Quest Support.

[Notes] VisibilityMode=<ValidKeyword>

Type:	Default:	Occurs in:
keyword (*None* or *System*)	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **None** vs. **System** radio-button choice in the Data Migration Wizard's *Notes User Visibility* screen. Valid values are *None* and *System*. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] WriteFailedMessageListToThisMbxFolder=<string>
[Notes] WriteFailedMessageListClass=<keyword(s)>

Type:	Defaults:	Occurs in:	New in:
string and keyword(s)	WriteFailedMessageListToThisMbxFolder=*[null]* WriteFailedMessageListClass=Errored	Data Migr	4.12.1

This pair of parameters together let you configure the Data Migration Wizard to generate a folder of items that are not migrated to the target. These items will be referenced as doclinks in a new folder in the user's Notes mailbox. The feature is enabled/disabled and configured by:

```
[Notes]
WriteFailedMessageListToThisMbxFolder=<string>
WriteFailedMessageListClass=<keyword(s)>
```

The *WriteFailedMessageListToThisMbxFolder* parameter specifies a name for the folder to be added to the user's mailbox, to contain the unmigrated items. *WriteFailedMessageListClass* specifies one or more types of unmigrated items for the feature to capture; valid keyword values are: *Errored*, *Skipped* and *Filtered*. To specify more than one type, separate multiple keywords by the pipe ("|") character, as in this example:

```
WriteFailedMessageListToThisMbxFolder=Unmigrated
WriteFailedMessageListClass=Errored|Skipped|Filtered
```

This example tells the wizard to create copies of any *Errored*, *Skipped* and/or *Filtered* items and save them in a new folder named *Unmigrated* in the user's mailbox.

The feature is enabled by entering any value for the *WriteFailedMessageListToThisMbxFolder* parameter. (If that parameter is omitted or its value is left empty, the feature is disabled and the *WriteFailedMessageListClass* parameter is ignored.) The feature is disabled by default (*WriteFailedMessageListToThisMbxFolder* is omitted or its value is [null]), and by default *WriteFailedMessageListClass=Errored* (only).

[Notify] section

[Notify] AdminRecipientsSMTP

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.16.1

This value corresponds to a GUI element in the Data Migration Wizard, the Recipient SMTP address text box in the **Send "Migration summary" messages to the administrators** section of the *Configure Migration Notification Messages* screen. The wizard writes the value to the Task Parameters based on this entry. You can enter multiple SMTP addresses, separated by a ";" (semi-colon). Quest recommends that you do not manually enter or change this value except at the direction of Quest Support.

[Notify] AdminSummarySubject

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.16.1

This value corresponds to a GUI element in the Data Migration Wizard, the Subject text box in the **Send "Migration summary" messages to administrators** section of the *Configure Migration Notification Messages* screen. The wizard writes the value to the Task Parameters based on the GUI entry. Quest recommends that you do not manually enter or change this value except at the direction of Quest Support.

[Notify] AdminSummaryTemplate

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.16.1

This value corresponds to a GUI element in the Data Migration Wizard, the Template file text box in the **Send "Migration summary" messages to administrators** section of the *Configure Migration Notification Messages* screen. The wizard writes this value to the Task Parameters based on the adminstrator's GUI entry. Quest recommends that you do not manually enter or change this value except at the direction of Quest Support.

[Notify] SenderDN=<DisplayName>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Sender Display Name text box in the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters based on an administrator's GUI entry; Quest recommends you do not manually enter or change this parameter value except at the direction of Quest Support.

[Notify] SenderSMTP=<SMTPAddress>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Sender SMTP Address** text box in the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this parameter value except at the direction of Quest Support.

[Notify] SendMailToSource=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Send "You've been migrated" messages to Notes mailboxes** check box in the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters based on an administrator's GUI entry; Quest recommends you do not manually enter or change this parameter value except at the direction of Quest Support.

[Notify] SendMailToAdminWithSummary

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Send "Migration summary" messages to administrators** check box of the *Configure Migration Notification Messages* screen. The wizard writes this value to the Task Parameters based on an administrator's GUI entry. Quest recommends that you do not manually enter or change this value except at the direction of Quest Support.

[Notify] SendMailToTarget

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Send "Welcome to Exchange" messages to Exchange mailboxes** check box in the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters based on the GUI entry. Quest recommends you do not manually enter or change this parameter value except at the direction of Quest Support.

[Notify] SMTPHost

Type:	Default:	Occurs in:	New in:
string	Microsoft 365: smtp.office365.com On-premises: none	Data Migr	4.16.1

Specifies the SMTP server that is used to send the migration summary email. For the Microsoft 365 Exchange server, this parametercheck box is updated by the Migration Console when the **Apply** button is clicked on the *Exchange Server* page. The URL associated with the selected Microsoft 365 environment is selected from the list of URLs in the `[MsOnlineSmtpHosts]` section. For an on-premises Exchange server, if this setting is empty, MNE automatically discovers the correct SMTP server through the PowerShell cmdlet *GetReceiveConnector*. Quest recommends that you do not manually enter or change this value except at the direction of Quest Support.

[Notify] SMTPPort

Type:	Default:	Occurs in:	New in:
integer	Microsoft 365: 587, On-premises: none	Data Migr	4.16.1

Specifies the SMTP server port that is used to send the migration summary email. For an on-premises Exchange server, if `[Notify] SMTPHost` is empty, MNE automatically discovers the correct SMTP server port through the PowerShell cmdlet *GetReceiveConnector*. Quest recommends that you do not manually enter or change this value except at the direction of Quest Support.

[Notify] SourceSubject=<SubjectText>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Subject** text box in the *You've been migrated* section of the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notify] SourceTemplate=<PathIncludingFilename>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the template file text box in the *You've been migrated* section of the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notify] TargetSubject=<SubjectText>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Subject** text box in the *Welcome to Exchange* section of the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this parameter value except at the direction of Quest Support.

[Notify] TargetTemplate=<PathIncludingFilename>

Type:	Default:	Occurs in:	New in:
string	[GUI entry]	Data Migr	4.1

This value corresponds to a GUI element in the Data Migration Wizard, the Template file text box in the **Welcome to Exchange** section of the *Configure mail-merge messages to migrating user* screen. The wizard writes this value to the Task Parameters from an administrator's GUI entry; Quest recommends you do not manually enter or change this parameter value except at the direction of Quest Support.

[Outlook] section

[Outlook] PstDirMode=<ValidKeyword>

Type:	Default:	Occurs in:
keyword (*DN* or *CSV*)	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Subdirectories of root directory...** vs. **Directory specified by the PstDir column...** radio-button choice in the *Personal Archive Location* screen. Valid values are "DN" and "CSV," where:

- *DN:* **Subdirectories of root directory specified below.**

- *CSV:* **Directory specified by the PstDir column....**

The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Outlook] PstFileNameFormat=<#>

Type:	Default:	Occurs in:	New in:
integer	1	Data Migr	4.15.2

Specifies a PST filename format. The parameter value must be one of the following integers:

- 0: Source Notes filename

- 1: User display name

- 2. User id

- 3: SMTP email address

- 4: Notes email address

> **i** | **NOTE:** If `PstFileNameFormat=0`, (Source Notes filename), MNE uses the default value `[General]` `UseSepartatePSTS=1` (migrate to multiple PSTfiles). Naming the PST file after the source Notes file implies that each PST target has a different file name.

[Outlook] PstRootDir=<AlphanumString>

Type:	Default:	Occurs in:
string	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the pst output root directory text box in the *Personal Archive Location* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[PAB] section

[PAB] SourceFolderCategory=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.0.0

Determines whether the Data Migration Wizard will tag migrated PAB entries with the Notes source folder category. For example:

SourceFolderCategory=1

... tells the Data Migration Wizard to tag migrated PAB entries with the Notes source folder category, as it always did in prior releases. By default (0) the wizard will not tag migrated PAB entries.

[PersonDocCustom] section

[PersonDocCustom] Count=<##>

Type:	Default:	Occurs in:	New in:
integer	0	Data Migr	4.1.5

Determines which *PersonDoc<#>* parameters (see below) the wizard will process in this [PersonDocCustom] section. If a *Count* parameter is specified with a value > 0, the wizard will read only *PersonDoc<#>* parameters whose differentiating digits are less than the *Count* parameter value. That is, the keyname digits of multiple *PersonDoc<#>* parameters need not form an uninterrupted numeric sequence, but if they don't the wizard will read only the parameters whose digits are less than the *Count* value.

For example, if:

    [PersonDocCustom]
    Count=3
    PersonDoc0=FullName
    PersonDoc2=MailDomain

```
PersonDoc3=FieldName3
PersonDoc5=FieldName5
```

... the wizard will read *PersonDoc0* and *PersonDoc2*, but not *PersonDoc3* or *PersonDoc5*, since neither 3 nor 5 is less than the value of the Count.

If unspecified, the *Count* parameter defaults to 0, in which case the wizard will read only the *PersonDoc<#>* parameters whose differentiating digits form an uninterrupted numeric sequence beginning at 0 (*PersonDoc0*).

[PersonDocCustom] MergeMultiValuedProperties=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.1.5

Determines whether a multi-valued assignment to a Notes person-document field (via the *<NotesFieldName>* parameter) will overwrite the current field contents (*MergeMultiValuedProperties=0*) or be added to the current contents (1). See the entry for *<NotesFieldName>* parameters, also in this [PersonDocCustom] section, for information about assigning multiple values to a single Notes field.

[PersonDocCustom] <NotesFieldName>=<value>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.1.5

Each *<NotesFieldName>* parameter assigns a value to the named Notes person-document field, but only if the *<NotesFieldName>* appears as the value of a corresponding *PersonDoc<#>* parameter (also in this [PersonDocCustom] section). Any such assignment will be ignored if the *<NotesFieldName>* has not been defined (to the wizard) by a *PersonDoc<#>* parameter.

The key name for a *<NotesFieldName>* parameter must match exactly the value of a corresponding *PersonDoc<#>* parameter that defines the *<NotesFieldName>* to the wizard. For example, to define these person-document fields and have the wizard assign values to them:

```
[PersonDocCustom]
PersonDoc0=FullName
FullName=JohnDoe
PersonDoc1=MailServer
MailServer=Server4
PersonDoc2=MailDomain
MailDomain=xyzcorp
```

Value assignments by these *<NotesFieldName>* parameters will overwrite any other person-document field values set by other features during migration, mail routing or Notes administrative functions. All the features facilitated by this [PersonDocCustom] section are enabled only if **Migrate users** is selected on the wizard's *Operations* screen.

If a Notes field capable of containing multiple values already contains one or more values, the *MergeMultiValuedProperties* parameter (also in this [PersonDocCustom] section) determines whether a value assignment via a *<NotesFieldName>* parameter will overwrite or be added to the current field contents.

For a multi-valued Notes field, you may assign multiple values via a *<NotesFieldName>* parameter by using a pipe character to separate the values, like this:

```
FullName=JohnDoe/sitraka | JohnDoe@sitraka.com
```

Any spaces preceding or following a pipe character are ignored.

To clear any existing contents of a Notes person-document field, define the *PersonDoc<#>* parameter for the field and add the corresponding *<NotesFieldName>* parameter with the value left blank, like this:

```
PersonDoc2=MailServer
MailServer=
```

[PersonDocCustom] PersonDoc<#>=<NotesFieldName>

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	4.1.5

Each *PersonDoc<#>* parameter defines a Notes person-document field to which the wizard can assign a value. The value assignment is accomplished by a corresponding *<NotesFieldName>* parameter (also in this [PersonDocCustom] section).

The Notes field defined by a *PersonDoc<#>* parameter may or may not already exist in Notes. If the field does not already exist in Notes, the wizard creates it. For example, to define the User Name and Mail Server fields in a person document, you might set:

        [PersonDocCustom]
        PersonDoc0=FullName
        PersonDoc1=MailServer

See the previous entry for *<NotesFieldName>* parameters for an example of how *PersonDoc<#>* and *<NotesFieldName>* parameters are used together to define person-document fields and have the wizard assign values to them.

PersonDoc<#> parameter values are case-insensitive:

        FullName = fullname = FULLNAME = fUIlLnAmE

The digits appended to *PersonDoc<#>* key names arbitrarily differentiate one parameter from another. Multiple *PersonDoc<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence if a *Count* parameter is also specified (also in this [PersonDocCustom] section) to determine which parameters to read and which to ignore. If the *Count* value > 0, the wizard will read only *PersonDoc<#>* parameters whose differentiating digits are less than the *Count* value. If no *Count* parameter is specified (or if *Count=0*), the wizard will read only *PersonDoc<#>* parameters whose digits form an uninterrupted numeric sequence beginning with 0.

All the features facilitated by this [PersonDocCustom] section are enabled only if **Migrate users** is selected on the wizard's *Operations* screen.

[PowerShell] section

[PowerShell] IdleConnectionTimeoutSeconds=<##>

Type:	Default:	Occurs in:
integer	30 or 60 (see below)	NMM, Data Migr, AD Grps, Prov

Determines how long (in seconds) Migrator for Notes to Exchange will hold open an idle remote PowerShell connection before closing it. This feature applies only to the duration of an idle state during a connection. Each command run resets this timer to zero, so a series of commands with only short idle periods between commands could keep the connection open indefinitely. The default *IdleConnectionTimeoutSeconds=30* is suitable for most environments.

IdleConnectionTimeoutSeconds=0 would tell Migrator for Notes to Exchange to not wait (wait 0 seconds) for a second command after a first, so would close any PowerShell connection immediately after only one command. The default is 30 seconds for migration to a proprietary Exchange, or 60 seconds for migration to Microsoft 365.

[PowerShell] MaxPowerShellConnections=<#>

Type:	Default:	Occurs in:
integer	0 (no limit)	NMM, Data Migr, AD Grps, Prov

Determines the migration-server-wide limit for the number of concurrent PowerShell connections Migrator for Notes to Exchange can open. For example, if *MaxPowerShellConnections=2*, a four-thread migration might proceed like this:

- Thread 1: Creates PowerShell connection.
- Thread 3: Creates PowerShell connection.
- Thread 2: Tries to create a connection, but they are used up so sleeps until a connection is available.
- Thread 4: Tries to create a connection, but they are used up so sleeps until a connection is available.
- Thread 3: Closes its PowerShell connection.
- Thread 2: Wakes up and creates a PowerShell connection.
- Thread 3: Tries to create a connection, but they are used up so sleeps until a connection is available.
- Thread 2: Closes its PowerShell connection.
- Thread 4: Wakes up and creates a PowerShell connection.

Note: The default setting (*MaxPowerShellConnections=0*) is interpreted as "no limit," effectively turning off this limiting feature.

[PowerShell] UseSSLConnection

Type:	Default:	Occurs in:	New in
boolean	0	NMM, Data Migr, AD Grps, Prov	4.16

Determines whether Migrator for Notes to Exchange will use a secure socket layer (SSL) connection to connect to the remote PowerShell session of an on-premises Exchange server. By default (0) the parameter does not use SSL to connect.

[ServerCalFolderFilter] section

[ServerCalFolderFilter] Count=<##>

Type:	Default:	Occurs in:
integer	10	Data Migr

A limit to the number of *Filter<#>* parameters (see below) that the Data Migration Wizard will process in this section. the wizard will read only *Filter<#>* parameters whose differentiating digits are less than the *Count* value. For example, if:

```
[ServerCalFolderFilter]
Count=15                 Filter2=~SENT          Filter12=~TRASH
Filter0=~INBOX           Filter7=~ROOT          Filter19=~DRAFTS
Filter1=~CALENDAR        Filter8=~TASKS
```

... the wizard reads all the parameters except *Filter19*, since *Count=15* and 19 > 15. If unspecified, the *Count* parameter defaults to 10. If specified, the parameter must occur as the first line of the section, as shown above.

[ServerCalFolderFilter] Filter<#>=<~FolderName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Identifies a Notes source folder from which server-based calendar-associated mail will be excluded from the migration. The Data Migration Wizard can discriminate between emails associated with calendar items (invitations, acceptance notifications, etc.), and other (non-calendar) emails, and can optionally exclude from the migration either type that originate from one or more designated source folders. Filter parameters in this [ServerCalFolderFilter] section identify the source folders from which server-based calendar-associated emails will be excluded. Other sections in these Default Settings may contain parameters to exclude other item types from certain source folders:

- [ServerMailFolderFilter] to exclude server-based non-calendar emails.
- [ArchiveCalFolderFilter] to exclude archived calendar-associated emails.
- [ArchiveMailFolderFilter] to exclude archived non-calendar emails.

Within each such section, each parameter identifies a single source folder to which the filter will be applied. For example: *[ServerCalFolderFilter] Filter0=~INBOX* tells the wizard to apply the filter to the Inbox, while the section name in this example tells the wizard that the filter should exclude calendar-associated emails that reside on the server. For each such parameter, the parameter value specifies the mailbox by prepending a tilde character to the mailbox name, as follows:

~INBOX: Inbox	~DRAFTS: Drafts	~TASKS: Tasks
~CALENDAR: Calendar	~ROOT: [Root Dir]	~TRASH: Trash
~SENT: Sent Items		

You may define one or more *Filter<#>* parameters within the section. The digit(s) appended to a *Filter<#>* key name differentiate one parameter from another. Multiple *Filter<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. For example, a section may contain only:

```
Filter0=~INBOX
Filter4=~SENT
Filter8=~TASKS
Filter5=~TRASH
```

But the wizard will read only *Filter<#>* parameters whose differentiating digits are less than a value specified by a *Count* parameter in the first line of the section. See the *Count* parameter above for more information.

[ServerData] section

[ServerData] MigrateCalData=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate calendar data** check box in the *Migrate mail data* section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ServerData] MigrateEncryptedMessages=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	3.2

Determines whether the wizard should attempt to migrate the encrypted portions of encrypted messages in the source server. Typical usage is described below. This feature can also be applied to encrypted messages in users' archives, by this same parameter name in the [ArchiveData] section of these parameters. The feature is also available for the SSDM (in *notesdtapp.ini*), but in SSDM the default is 1.

The Data Migration Wizard can migrate the encrypted portion of an encrypted message only if it has the access credentials of the user who is authorized to decrypt the encrypted portion. An encrypted message also contains unencrypted portions, which the wizard can migrate in any case, even if it lacks the credentials to migrate the encrypted portion. In that case, the wizard can migrate the unencrypted portions, skip the encrypted portions, and insert text notices that the encrypted portions could not be migrated.

In most organizations, only the sender or recipient of an encrypted message is authorized to access the encrypted portion, and the wizard will not know those credentials unless the admin account running the wizard happens to be the sender or recipient of the encrypted message. It is possible, but uncommon, for an environment to be configured with broader or even universal access to the encrypted portions of encrypted messages, and in that case the wizard can freely migrate encrypted messages in their entirety. But in the more likely case where the access credentials are much more restrictive, the wizard will be unable to migrate the encrypted portions of encrypted messages.

This *MigrateEncryptedMessages* parameter lets you choose whether the wizard should even attempt to migrate the encrypted portions of encrypted messages. If access credentials for encrypted messages are more restrictive, the default *MigrateEncryptedMessages=0* tells the wizard to not even attempt migrating the encrypted portions, but to just migrate the unencrypted portions with the substitute notice.

This option may improve performance simply by eliminating a wizard function that is rarely if ever needed in that scenario. Many organizations with restrictive access credentials simply use Migrator for Notes to Exchange's SSDM to migrate encrypted messages, since the SSDM will always have the access credentials of the user who is running it.

If *MigrateEncryptedMessages=1*, the wizard will attempt to migrate the encrypted portions, and will succeed or fail depending on whether the admin account running the wizard has the necessary credentials. If it fails, the wizard will migrate the message, skip the unencrypted portions and insert the substituted notice—the same outcome as for *MigrateEncryptedMessages=0*.

A related parameter lets you tell the wizard to skip an entire message (both encrypted and unencrypted portions) if the wizard is already configured to skip the encrypted portion (only) by *MigrateEncryptedMessages=0*. See *SkipEntireEncryptedMessage* in this same [ServerData] section for more information.

[ServerData] MigrateMailData=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate e-mail messages** check box in the *Migrate mail data* section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ServerData] MigrateTaskData=<#>

Type:	Default:	Occurs in:	New in:
boolean	[GUI entry]	Data Migr	4.2.1

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate task data** check box in the *Migrate mail data* section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ServerData] MigrateTrashFolder=<#>

Type:	Default:	Occurs in:
boolean	[GUI entry]	Data Migr

This value corresponds to a GUI element in the Data Migration Wizard, the **Migrate trash folder** check box in the *Migrate mail data* section of the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ServerData] MigrateViews=<#>

Type:	Default:	Occurs in:
keyword (single digit 0, 1 or 2)	0 (but the wizard initializes the value to 1)	Data Migr

Determines whether and how the Data Migration Wizard will migrate archive items that occur within Notes views. For example, *MigrateViews=1* tells the wizard to migrate items only from the first view in which they are found. Valid parameter values are:

> 0 (default): No views are migrated.
> 1: Items are migrated only from the first view in which they are found.
> 2: Items are migrated from all views in which they are found.

Note that the wizard will initialize this parameter to 1 if it is omitted from the task INI file, even though technically the program default is 1. You must explicitly include the parameter in Global Defaults or Task Parameters if you want the wizard to run with *MigrateViews=0* or *MigrateViews=2*.

[ServerData] OOF=<#>

Type:	Default:	Occurs in:
boolean	0	Data Migr

Determines whether the wizard will migrate out-of-office messages. For example, *OOF=1* tells the wizard to migrate out-of-office messages. By default (*OOF=0*), the wizard will not migrate out-of-office messages.

If the wizard is set to migrate out-of-office messages (*OOF=1*), the behavior can be configured using the `[Exchange] AllowExternalOOF` parameter.

> **i** | **NOTE:** Migration of out-of-office messages *(OOF=1)* is not supported if the migration target is set to **Personal folder (.pst)**.

[ServerData] SkipEntireEncryptedMessage=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.6

Determines whether the Data Migration Wizard will skip entire encrypted messages (skip both encrypted and unencrypted portions) in the source server data if the wizard is already configured to skip the encrypted portions by *MigrateEncryptedMessages=0* (also in this [ServerData] section).

SkipEntireEncryptedMessage=1 tells the wizard to skip any encrypted messages entirely if *MigrateEncryptedMessages=0*. This *SkipEntireEncryptedMessage* parameter is irrelevant and ignored if *MigrateEncryptedMessages=1*.

For more information about how encrypted messages are migrated, and how this *SkipEntireEncryptedMessage* parameter helps control how the wizard processes encrypted messages, see the parameter notes for the *MigrateEncryptedMessages* parameter earlier in this [ServerData] section.

[ServerMailFolderFilter] section

[ServerMailFolderFilter] Count=<##>

Type:	Default:	Occurs in:
integer	10	Data Migr

A limit to the number of *Filter<#>* parameters (see below) that the Data Migration Wizard will process in this section. the wizard will read only *Filter<#>* parameters whose differentiating digits are less than the *Count* value. For example, if:

```
[ServerMailFolderFilter]
Count=15
Filter0=~INBOX
Filter1=~CALENDAR
Filter2=~SENT
Filter7=~ROOT
Filter8=~TASKS
Filter12=~TRASH
Filter19=~DRAFTS
```

... the wizard will read all the parameters except *Filter19*, since *Count=15* and 19 > 15. If unspecified, the *Count* parameter defaults to 10. If specified, the parameter must occur as the first line of the section, as shown above.

[ServerMailFolderFilter] Filter<#>=<~FolderName>

Type:	Default:	Occurs in:
string	[none]	Data Migr

Identifies a Notes source folder from which server-based non-calendar mail will be excluded from the migration. The Migrator for Notes to Exchange can discriminate between emails associated with calendar items (invitations, acceptance notifications, etc.), and other (non-calendar) emails, and can optionally exclude from the migration either type that originate from one or more designated source folders. Filter parameters in this [ServerMailFolderFilter] section identify the source folders from which server-based non-calendar emails will be excluded. Other Migrator for Notes to Exchange parameters may also exclude other item types from certain source folders, in one or more of these sections:

- [ServerCalFolderFilter] to exclude server-based calendar-associated emails.
- [ArchiveCalFolderFilter] to exclude archived calendar-associated emails.
- [ArchiveMailFolderFilter] to exclude archived non-calendar emails.

Within each such section, each parameter identifies a single source folder to which the filter will be applied. For example:

```
[ServerMailFolderFilter]
Filter0=~INBOX
```

... tells the wizard to apply the filter to the *Inbox*, while the section name in this example tells the wizard that the filter to be applied should exclude mail items (non-calendar-associated emails) that reside on the server. For each such parameter, the parameter value specifies the mailbox by prepending a tilde character to the mailbox name, like these examples:

~INBOX: Inbox	~ROOT: [Root Dir]
~CALENDAR: Calendar	~TASKS: Tasks
~SENT: Sent Items	~TRASH: Trash
~DRAFTS: Drafts	

You may define one or more *Filter<#>* parameters within the section. The digit(s) appended to a *Filter<#>* key name differentiate one parameter from another. Multiple *Filter<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. For example, a section may contain only:

```
Filter0=~INBOX
Filter4=~SENT
Filter8=~TASKS
Filter5=~TRASH
```

But the wizard will read only *Filter<#>* parameters whose differentiating digits are less than a value specified by a *Count* parameter in the first line of the section. See the *Count* parameter above for more information.

[TimeZoneInfo] section

Exchange uses time zone identifiers that correspond with time zones found in the Windows time zone database. Depending on the client application used to create an appointment or meeting, the Notes calendar item being migrated may not contain the specific time zone code that is used by Exchange. For example, if an appointment is created using an application on an Apple device, the time zone code in the appointment will not match any of the known Windows time zones. To help the migration software identify the appropriate Windows time zone, specify a list of preferred Windows time zones in the `[TimeZoneInfo]` section.

To understand how the list of preferred time zones is used, the algorithm that is used to select the appropriate time zone from the Windows time zone database is described below.

1   The time zone information provided in the Notes meeting is compared to the collection of time zones defined in the Windows time zone database. A list of potential matches is generated. If the list of potential matches contains a single time zone, it is selected. If the meeting was created by a Notes client running on a Windows operating system, a unique match here is probable.

2   If a unique match is not found, a list of preferred time zones (configured in the `[TimeZoneInfo]` section) is compared to the list of potential matches. The first successful compatible match from the list of preferred time zones is selected.

3   If no time zone was selected in step 2, the Windows system current local time zone's properties are compared to the time zone information from the Notes meeting. If they are compatible, the local time zone is selected.

4   If the local time zone is not compatible, the first time zone from the list of potential matches is chosen.

5   If none of the time zones defined in the Windows time zone database are found to be potential matches, the local time zone is used.

The `[TimeZoneInfo]` section lists your preferred time zones from the Windows Time Zone database. Each time zone is specified with its unique identifier. You can retrieve a full list of Windows time zone identifiers using the following PowerShell cmdlet:

```
[System.TimeZoneInfo]::GetSystemTimeZones() | Sort-Object DisplayName | ft -
autosize DisplayName, Id
```

The cmdlet returns a table of time zone **DisplayName** and **Id** values.

The **Id** value is used in the `[TimeZoneInfo]` section. The `[TimeZoneInfo]` collection is configured by providing the **Id** values of the preferred time zones. Each value in the `[TimeZoneInfo]` section should be prefixed with the name `TimeZoneN`, where `N` represents a counter starting at 0. Below is a sample configuration of the `[TimeZoneInfo]` section:

```
[TimeZoneInfo]

TimeZone0=Eastern Standard Time

TimeZone1=Central Standard Time

TimeZone2=Mountain Standard Time

TimeZone3=Pacific Standard Time

TimeZone4=Alaskan Standard Time

TimeZone5=Hawaiian Standard Time
```

[TimeZoneNames] section

For most migrations, configuring the `[TimeZoneInfo]` section should be sufficient to determine the correct time zone for scheduled meetings and appointments. However, if two very similar time zones are being used, the migration may have difficulty identifying the correct time zone. Configuring the `[TimeZoneNames]` section can provide additional guidance.

Each Notes meeting and appointment contains a time zone description string similar to the following:

```
StartTimeZone = "Z=5$DO=1$DL=3 2 1 11 1 1$ZX=0$ZN=America/New_York"
```

The `ZN` parameter of the string identifies the name of the time zone. If the appointment was scheduled from a Windows client or browser, the name corresponds to a name in the Windows time zone database and a unique time zone match is assured. If the appointment was scheduled from a mobile device or a non-Windows operating system, the time zone name will not match a Windows time zone and additional steps must be taken.

In the example shown above, scheduled from an Android device, the time zone `America/New_York` corresponds to the Windows time zone identifier `Eastern Standard Time`. You can configure the `[TimeZoneNames]` section to map non-Windows time zone names to their Windows equivalent. For example:

```
[TimeZoneNames]
America/New_York=Eastern Standard Time
```

The value on the right corresponds to the identifier of the Windows time zone. See the `[TimeZoneInfo]` section for details on retrieving the correct time zone identifier.

[Titles] section

[Titles] "Title" field translations

Type:	Default:	Occurs in:	New in:
string	[none]	Data Migr	3.2

The parameters in this [Titles] section specify Chinese equivalents of English-language courtesy titles. Notes saves the Titles in English, but displays them in the localized language, so the migration program can migrate only the stored English-language titles. These parameters are therefore necessary to convert the migrated English-language titles into the appropriate localized Chinese equivalents in Exchange. For example:

```
[Titles]
Mr.= 先生
Mrs.= 夫人
Miss= 小姐
```

Each parameter tells the program to convert the title listed as the keyword (left of the = sign) to the Chinese string to the right of the = sign.

[User] section

All parameters in this [User] section are internal transient parameters, used by the program to pass information from one subroutine to another. Any manual manipulation of these parameters is meaningless and will have no affect on the program or data, since any preexisting parameter values are overwritten by the program as soon as it runs. Parameters in this section include:

adAttribute=
ArchivePaths=
DisplayName=
Domain=

Parameters for the Self-Service Desktop Migrator (SSDM)

[ArchiveData] section

[ArchiveData] MigrateCalData=<#>

Type: boolean	Default: 1

Determines whether the program will migrate calendar data among the archives. For example:

    MigrateCalData=0

... tells the program to not migrate archive calendar data. By default (*MigrateCalData=1*), the program will migrate archive calendar data.

[ArchiveData] MigrateEncryptedMessages=<#>

Type: boolean	Default: 1		New in ver 3.2

Determines whether the SSDM should attempt to migrate the encrypted portions of encrypted messages in the source user archives. This feature can also be applied to encrypted messages in the source server, by this same parameter name in the [ServerData] section of *notesdtapp.ini*. The feature is also available for the Data Migration Wizard (same parameters in the same sections, but in Migrator for Notes to Exchange's Global Defaults and Task Parameters), but in the wizard the default is 0.

The SSDM can migrate the encrypted portion of an encrypted message if it has the access credentials of the user who is authorized to decrypt the encrypted portion. This is the typical case in most organizations who use the SSDM, where individual users run the SSDM under their own login credentials, to migrate their own data. But in the rare case where the access credentials for a user's encrypted data are different from the credentials of the user running the program, this parameter lets you control how the SSDM should handle encrypted data. If the program attempts to migrate an encrypted message but lacks the necessary credentials, it can migrate the unencrypted portions, skip the encrypted portions, and insert text notices to explain that the encrypted portions could not be migrated. On the other hand:

> MigrateEncryptedMessages=0

… tells the SSDM to not even attempt migrating the encrypted portions, but to just migrate the unencrypted portions and insert the notice text. If *MigrateEncryptedMessages=1*, the program will attempt to migrate the encrypted portions, and will succeed or fail depending on whether the account running the SSDM has the necessary credentials. If it fails, the SSDM will migrate the message, skip the unencrypted portion and insert the notice—the same outcome as for *MigrateEncryptedMessages=0*.

A related Migrator for Notes to Exchange parameter lets you tell the SSDM to skip an entire message (both encrypted and unencrypted portions) if the program is already configured to skip the encrypted portion (only) by *MigrateEncryptedMessages=0*. See *SkipEntireEncryptedMessage* in this same [ArchiveData] section for more information.

[ArchiveData] MigrateMailData=<#>

Type: boolean	Default: [GUI entry]

This value corresponds to a GUI element in the SSDM: the **Migrate archive** check box of the *Specify Data for Migration* screen. The SSDM writes this value to *notesdtapp.ini* from the user's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[ArchiveData] MigrateTaskData=<#>

Type: boolean	Default: 1	New in ver 4.2.1

Determines whether the program will migrate task data among the archives. For example: *MigrateTaskData=0* tells the program to not migrate archived tasks. By default (*MigrateTaskData=1*), the program will migrate archived tasks.

[ArchiveData] MigrateTrashFolder=<#>

Type: boolean	Default: 1

> MigrateTrashFolder=0

... tells the program to not migrate the trash folder if the *Specify Data for Migration* screen does not appear, or sets the associated check box in that screen to be unmarked by default. The default setting (*MigrateTrashFolder=1*) tells the program to migrate the trash folder if the screen does not appear, or sets the associated check box to be marked by default. The most common use of this parameter is to provide the necessary entry value when the program is configured to hide the *Specify Data* screen. Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how this parameter relates to others used to customize the SSDM.

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

154

[ArchiveData] MigrateViews=<#>

Type: keyword	Default: 0 (but the program initializes the value to 1)

Determines whether and how the SSDM will migrate archive items that occur within Notes views. For example: *MigrateViews=1* tells the SSDM to migrate items only from the first view in which they are found. Valid parameter values are:

> 0 (default): No views are migrated.
> 1: Items are migrated only from the first view in which they are found.
> 2: Items are migrated from all views in which they are found.

Note that the SSDM will initialize this parameter to 1 if it is omitted from *notesdtapp.ini*, even though technically the program default is 1. You must explicitly include the parameter in *notesdtapp.ini* if you want the SSDM to run with *MigrateViews=0* or *MigrateViews=2*.

[ArchiveData] RecordOriginalFolderNameAsKeyword=<#>

Type:	Default:	New in:
boolean	1	4.16.1

Determines whether the SSDM, when migrating archives to a different target folder, will add a keyword to the archive message that identifies the message's original folder name. For example, a different target folder would include subfolders under a pseudo root (with [ArchiveData] UsePseudoRoot=1) as compared to the primary Outlook mailbox (the main root).

> RecordOriginalFolderNameAsKeyword=0

... tells the program not to add the keyword in the format of "Folder: ArchiveTitle\\OriginalFolderName" to the archive message when migrating it to a different target folder. By default (1), the program adds the keyword to the migrated archive message.

[ArchiveData] SkipEntireEncryptedMessage=<#>

Type:	Default:	New in
boolean	0	4.6

Determines whether the SSDM will skip entire encrypted messages (skip both encrypted and unencrypted portions) in the source user archives if the SSDM is already configured to skip the encrypted portions by *MigrateEncryptedMessages=0* (also in this [ArchiveData] section).

> SkipEntireEncryptedMessage=1

… tells the program to skip any encrypted messages in their entirety if *MigrateEncryptedMessages=0*. This *SkipEntireEncryptedMessage* parameter is irrelevant and ignored if *MigrateEncryptedMessages=1*.

For more information about how encrypted messages are migrated, and how this *SkipEntireEncryptedMessage* parameter helps control how the SSDM processes encrypted messages, see the parameter notes for the *MigrateEncryptedMessages* parameter earlier in this [ArchiveData] section.

[Categories] section

These [Categories] parameters are all auto-set parameters (see GUI-set and other "auto-set" parameters) that define the Outlook categories that correspond to various English equivalents. The Setup program automatically sets these parameters to their English defaults. If a default is not correct for your locale, be sure to change it before you run the SSDM.

[Categories] C=<LocalizedCategoryName>

Type: string	Default: Clients

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *C=Clients*

[Categories] H=<LocalizedCategoryName>

Type: string	Default: Holiday

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *H=Holiday*

[Categories] P=<LocalizedCategoryName>

Type: string	Default: Projects

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *P=Projects*

[Categories] PC=<LocalizedCategoryName>

Type: string	Default: Phone Calls

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *PC=Phone Calls*

[Categories] T=<LocalizedCategoryName>

Type: string	Default: Travel

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *T=Travel*

[Categories] V=<LocalizedCategoryName>

Type: string	Default: Vacation

See the explanatory note at the beginning of this [Categories] section. The English equivalent (default) for this parameter is: *V=Vacation*

[ErrorsToIgnore] section

[ErrorsToIgnore] Error<#>=[####-###-###-########]

Type: keyword	Default: [none]

Each *Error<#>* parameter identifies a single particular runtime error that the program should ignore when documenting its activities and outcomes in its log file. Each parameter value:

• Must conform to the form shown here, consisting entirely of digits and hyphens enclosed within square brackets: *[####-###-###-########]*.

• Must be the full, exact string of a single defined error code (no wildcards or substrings).

For example:

```
[ErrorsToIgnore]
Error0=[1465-32-4-00000000]
Error1=[7442-1-155-80072035]
Error2=[1400-31-108-00000000]
```

The digit(s) appended to an *Error<#>* key name arbitrarily differentiate one parameter from another. Multiple *Error<#>* parameters need not appear in numerical order, need not form an uninterrupted numeric sequence, and need not begin at 0. But the SSDM will read only *Error<#>* parameters whose differentiating digits are within the range 0-99 inclusive.

[Exchange] section

[Exchange] AddPstFilesToProfile=<#>

Type: boolean	Default: 1	New in ver 4.15.1.315

When the SSDM migrates an archive to a PST file, the SSDM by default registers the PST file in the Outlook profile that was selected for the migration. To prevent the generated PST file from being registered in the Outlook profile, set this parameter to 0.

[Exchange] AdjustTaskReminderToMidnight=<#>

Type:	Default:	New in:
boolean	1	4.15.1

In Notes and iNotes, when users set a task reminder to X days, hours, minutes before or after the task start date, the alarm notification is triggered X days, hours, minutes before or after 12:01 PM of the task start date.

When this parameter is set to the default value (1), after migration the alarm notification is triggered X days, hours, minutes before or after 12:00 AM instead of 12:01 PM.

To retain the Notes task alarm behavior and trigger the alarm before or after 12:01 PM, set this parameter to 0.

[Exchange] AllowHTMLCalendarBodies=<#>

Type: boolean	Default: 1	New in ver 4.4.1

Determines whether HTML information in the *Description* field of calendar appointments and tasks will migrate. The default:

    AllowHTMLCalendarBodies=1

… tells the SSDM to migrate such information. The feature can be disabled by *AllowHTMLCalendarBodies=0*.

[Exchange] AppendSMTPAddressToContactsDisplayName=<#>

Type: boolean	Default: 0

Tells the SSDM whether to automatically write the display names of Notes' email 2 and email 3 in the form Display Name (SMTP Address)— e.g., *Joe Example (joeex@email.com)*. This feature, intended to make the type-ahead feature easier to use, can be enabled by

    AppendSMTPAddressToContactsDisplayName=1

… but is off (0) by default.

[Exchange] ArchiveResolveAttendees=<#>

Type: boolean	Default: 1

Applies to data being migrated to a PST file. It tells the program to do an Exchange GAL lookup of attendees of migrated items to retrieve their Exchange addresses. Successfully resolved attendees are migrated to the target using their Exchange addresses instead of their SMTP addresses. This is required for free-busy lookups to succeed. You can disable this feature by setting the parameter to 0.

For example, to migrate data to PST files without connecting to the Exchange server, set:

    ArchiveResolveAttendees=0

... and also, in the [General] section:

    [General]
    PABDest=PST
    ServerMailDest=PST
    Type=PST
    PublicDelegates=0

[Exchange] AutodiscoverPreferInternalUrl=<#>

Type:	Default:	New in:
boolean	1 (on-premises) or 0 (Microsoft 365)	4.16.0

The Exchange Autodiscover service can return two sets of URLs in its query responses:

- Internal URLs

- External URLs

If this parameter is not configured, MNE selects the URL that is appropriate to the location of the mailbox. If the mailbox is on an on-premises Exchange server, MNE gives preference to the internal URLs. If the mailbox is an online mailbox in Microsoft 365, MNE gives preference to the external URLs. The default behavior can be overridden by setting this parameter to 1 (prefer internal URL) or 0 (prefer external URL).

> **i** | **NOTE:** if the Autodiscover service returns only a single URL, internal or external, that URL is used regardless of this setting.

[Exchange] AzureApplicationClientId=<registered_App_Client_ID>

Type:	Default:	New in:
string	[none]	4.16.1

Identifies the registered application client ID for the Microsoft Azure portal. This setting is updated by the Migration Console when the Apply button is clicked on the Exchange Server page after the user has performed an App Registration and successfully registered Migrator for Notes to Exchange with the Microsoft Azure portal.

To migrate oversized attachments or messages, this parameter is required when [Exchange] MigrateOversizedAttachments is enabled so the tool can access and upload large attachments to the OneDrive store owned by the mailbox user.

[Exchange] CalMaxRecurrenceFix=<#>

Type: keyword (single digit 0, 1 or 2)	Default: 0	New in ver 4.3

Specifies the method the SSDM uses to process a recurring meeting series that contains more occurrences in Notes than the 999 maximum allowed by Exchange. Without this control, attempts to migrate such meetings to Exchange 2010 would fail when the number of recurring instances exceeds the Exchange maximum.

For example:

```
[Exchange]
CalMaxRecurrenceFix=1
```

... tells the SSDM to convert the item to a recurring series with no end date which migrates cleanly.

The parameter value is a keyword that must be one of the following values:

0 (default): The item is migrated as-is. (Migration to Exchange 2010 will fail for series with > 999 occurrences.)

1: SSDM converts the item to a recurring series with no end date which migrates cleanly.

2: SSDM converts the item to a recurring series with 999 occurrences (the Exchange maximum).

A migrated appointment will appear in Outlook with the same number of occurrences as in Notes until the recurrence pattern is edited by the user, at which time it will assume the option set by this parameter.

Specifies the method the SSDM should use to process a recurring meeting series that contains more occurrences.

[Exchange] CheckMigratedItemsOnFolderLevel=<#>

Type:	Default:	New in:
boolean	1	4.16.1

This parameter is used only when migrating using MNE MAPI/HTTP. For more information, see[Exchange] UseMneMapiHttpLib=<#> on page 167.

Tells the SSDM to check if the Notes items are already migrated to Exchange based on the folder level or mail store level. This parameter allows you to avoid creating duplicate items in Exchange by using the [Exchange] RemigrateMode parameter.

For example, the default (CheckMigratedItemsOnFolderLevel=1) tells the SSDM to check if the Notes Items have already been migrated based on the folder level. CheckMigratedItemsOnFolderLevel=0 tells the SSDM to check if the Notes Items have already been migrated based on the mail store level.

[Exchange] DisableModernAuthentication=<#>

Type:	Default:	New in:
boolean	0	4.16.0

When connecting to the target mailbox, MNE must authenticate with the Exchange Server or Microsoft 365. MNE automatically selects the correct type of authentication to use based on the authentication mechanisms that are enabled on the server. If the server supports Modern Authentication, it is selected as the preferred authentication mechanism.

Disable Modern Authentication by setting `DisableModernAuthentication=1`. When disabled, MNE will fall back on another one of the mechanisms supported by the server (e.g. Basic Authentication).

Modern Authentication is primarily used when migrating to Microsoft 365. Microsoft does support using Modern Authentication with on-premises Exchange servers in a Hybrid Authentication configuration. However, MNE has not been validated for use with Hybrid Authentication. If you run into issues, you may need to disable Modern Authentication using this parameter.

[Exchange] ExtractEmbeddedImages=<#>

Type:	Default:	New in:
boolean	1	4.11

Enables or disables an option to extract images from Notes messages and replace and migrate the images as OLE Device Independent Bitmap object attachments -OR- migrate the original images to a OneDrive store. Original images are migrated to OneDrive when the following conditions are met:

• migration target is Microsoft 365

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

159

- *[Exchange] MigrateOversizedAttachments* is set to 1 (enabled)

- extracted image sizes are larger than the value specified by *[Filter] AttachSize*.

  The *[Filter] AttachSize* parameter corresponds to the **Attachment sizes** filter on the "Specify Dates and Size Filters" page in the Migrate User Data wizard.

This option makes images renderable in both OWA and the Office web client and is enabled by default (1). To disable the option, set *ExtractEmbeddedImages=0*.

TIP: If an OLE Device Independent Bitmap uses significantly more storage than the original source image, you could reduce the storage requirements by using the *MaxExtractedImageArea* parameter.

[Exchange] MAPIRetryCount=<#>

Type:	Default:	New in:
integer	The value specified by the `[Exchange] MessageRetryCount` parameter	4.15.1.257

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 167.

Determines the number of additional attempts that MNE will make to recover from a MAPI API function that fails with one of the errors listed in the `MAPIErrorsToRetry` parameter. If a MAPI retry error occurs, MNE waits for the amount of time specified by the `MessageRetryWait` parameter, and attempts to run the MAPI API function again.

If the API function continues to fail and returns MAPI retry errors, once the `MAPIRetryCount` limit is reached MNE makes a new attempt to store the message using a new MAPI session, as described by the `MessageRetryCount` parameter.

If this parameter is not set, it defaults to the value that is specified by the `MessageRetryCount` parameter.

[Exchange] MaxExtractedImageArea=<##>

Type:	Default:	New in:
integer	0	4.15.1.172

This setting is applied when the *[Exchange] ExtractEmbeddedImages parameter* is enabled.

During migration, images that are extracted from emails are either converted to BMP images before being stored in Exchange as message attachments -OR- the original images are uploaded to the user's OneDrive store.

Converting an image to BMP format can result in an image that has a data size many times larger than the original image. Due to the technical limitations of RTF format, it is not possible to use other, more efficient image formats that support data compression.

To mitigate the impact to the target mailbox size by emails that contain large embedded images, you can use the *MaxExtractedImageArea* setting to specify the maximum allowable image area, in pixels, of the generated BMP image. During the conversion, if the limit is exceeded, the embedded image is removed from the email body and is replaced with the original Notes image stored as a standard file attachment on the migrated message.

For example, to specify that images larger than 640 x 480 (307200) pixels should be removed from the email body and migrated as file attachments, set MaxExtractedImageArea=307200. However, if you set extracted images to be migrated to a OneDrive store, the parameter is ignored.

By migrating the source image in its original format and storing it in Exchange as a message attachment, the source image data compression is retained with no loss in image quality. Though the image is no longer displayed in the email body in Outlook or OWA, users can open the images from the email client to view the image content.

Original images are uploaded to OneDrive if the *Migrate Oversized Attachments* option is enabled for Microsoft 365 mailbox migration and the extracted image sizes exceed the limit specified by the *[Filter] AttachSize* parameter.

When *MaxExtractedImageArea=0*, the image is migrated to Exchange with no size limit applied.

[Exchange] MaxMailboxConnectionRetryWaitTime=<#>

Type:	Default:		New in:
integer	5		4.16.0

When MNE fails to connect to the target mailbox due to an error that might be transient (such as a network communication fault), MNE will make additional attempts to connect to the target mailbox. This parameter imposes a limit on the amount of time that MNE will spend retrying to open the connection.

The maximum time is specified in minutes. If the connection cannot be established within the amount of time specified, the migration to the target mailbox will be abandoned.

[Exchange] MaxSessionReconnectCount=<#>

Type:	Default:		Updated in:
integer	20		4.15.1.257

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 167.

Determines the maximum number of times that MNE will attempt to reconnect the MAPI session if a message fails to migrate due to one of the errors that are specified by the MAPIErrorsToRetry parameter. MNE pauses between each reconnect attempt for the number of seconds specified by the MessageRetryWait parameter.

If MNE is unable to open a new MAPI session after MaxSessionReconnectCount attempts, the migration is abandoned.

[Exchange] MessageRetryCount=<#>

Type:	Default:		Updated in:
integer	2		4.15.1.257

This parameter is used only when migrating using Outlook MAPI. Most migrations will use the MNE MAPI/HTTP library instead. For more information, see [Exchange] UseMneMapiHttpLib=<#> on page 167.

If a message fails to migrate due to one of the MAPI errors specified by the MAPIErrorsToRetry parameter, this parameter determines the maximum number of additional attempts that MNE will make to store the message. When MNE fails to store a migrated message to the target mailbox due to a MAPI retry error, MNE closes the existing MAPI session, opens a new session, and attempts to store the message again.

If MNE is unable to open a new MAPI session, it continues to make additional attempts to connect with MAPI, as described by the MaxSessionReconnectCount parameter. MNE pauses between each reconnect attempt for the number of seconds specified by the MessageRetryWait parameter.

If MNE is able to successfully open new MAPI sessions, but attempts to store the message continue to fail and the MessageRetryCount limit is reached, MNE logs the MAPI error and the failure to migrate the current message. MNE proceeds to the next message to be migrated.

[Exchange] MessageRetryWait=<##>

Type:	Default:		New in:
integer	30		4.6

Sets the delay (in seconds) between retry attempts for MAPI API functions that fail with one of the errors specified by the MAPIErrorsToRetry parameter, as documented by the MAPIRetryCount parameter.

The parameter also specifies the delay (in seconds) between MAPI session reconnect attempts, as documented by the MessageRetryCount parameter.

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

161

[Exchange] MigrateMeetingFYIAsResource=<#>

Type: boolean	Default: 1	New in ver 4.13

Determines whether the SSDM will migrate the FYI attendees of a Notes meeting to the *bcc* field in Exchange, where they will appear as Resources, instead of to the *cc* field. This option keeps FYI attendees hidden if the organizer later changes the meeting, since Exchange sends notifications of such changes, and those notices would otherwise disclose the FYI attendees as *Optional Attendees*.

By default (*MigrateMeetingFYIAsResource=1*), the SSDM migrates FYI attendees of a Notes meeting to the *bcc* field in Exchange. You can disable the feature (0) to make the SSDM migrate FYI attendees to the *cc* field.

[Exchange] MigrateOversizedAttachments=<#>

Type:	Default:	New in:
keyword (single digit 0 or 1)	0	4.16.1

Used only when migrating with the MNE MAPI/HTTP library, which is used when the [Exchange] UseMneMapiHttpLib parameter is set to the default setting of 1 as in [Exchange] UseMneMapiHttpLib=1.

Tells the SSDM whether to migrate an oversized message or an oversized message attachment when target is Microsoft 365. For example:

> MigrateOversizedAttachments=0

... tells the wizard to skip migrating the message attachment or the message that exceeds the size limit (such as 25 MB for message attachments or 150 MB for messages) to the Exchange Online target.

The parameter value is a single-digit integer which must be one of these two valid values:

> 0 (default): Skips migrating attachments that exceed the limit imposed by Microsoft 365 for the mailbox. Instead placeholder attachments are created that show the attachment is too large to be migrated directly to Exchange Online.

> 1 Migrates the oversized attachments to the Microsoft 365 OneDrive store owned by the mailbox user and provides a web link to the attachment as part of an HTM file attachment in the migrated message.

i | **NOTE:** The maximum size limit for attachments is set in the SSDM on the *Select Date and Size Filters* screen. You can modify the maximum attachment size on that screen but the size should not exceed the maximum attachment size allowed by Microsoft 365.

[Exchange] MigrateRtfToHtml=<#>

Type:	Default:	New in:
boolean	0	4.16.1

Determines whether MNE converts Notes RTF (rich text format) to HTML format when migrating a Notes message body in RTF. MNE uses a Notes built-in API to convert RTF to HTML. The feature is off (0) by default. The following limitations apply:

- This feature is disabled if MNE is running in offline mode ([Notes] Offline=1) or the Notes User ID path or password is not set.

- The Domino HTML APIs only support Memo type for the Notes client.

- Some application, document, database, view, or folder links might be lost after converting to HTML.

- Only Domino/Notes version 8.5.3 or later is supported.

MNE will export Notes RTF to MS RTF if MNE fails to convert Notes RTF to HTML or the feature is disabled.

[Exchange] MigrateTopicAsCategory=<#>

Type:	Default:		New in:
boolean	0		4.16.0

Some special Notes Databases contain a Topic field which works the same as the Category field (Keywords attribute) in Exchange. Currently the SSDM will migrate the Topic as Subject in Exchange causing multiple messages to have the same Subject value but it is actually the Topic value.

By default (MigrateTopicAsCategory=0), the SSDM does not change the logic as the source does not contain a Topic field in most cases, If you set this parameter to 1, the SSDM migrates the Topic as Category, and does not migrate the Topic as Subject. Quest recommends you enable the parameter only when you encounter the issue in which the Topic field is incorrectly migrated as Subject for a special Database.

[Exchange] OversizedAttachmentsTargetFolderPath=<folderPath>

Type:	Default:		New in:
string	Email_Attachments		4.16.1

Specifies the folder path relative to the mailbox user's OneDrive store root to which oversized attachments will be uploaded. The folder name can be separated with / or \ but cannot contain any of the special characters (such as ~ " # % & * : < > ? / \ { | } that are not allowed by OneDrive.

If the specified folder path is found to be invalid when the SSDM is uploading oversized files, an error is logged and the store root is used as the target folder instead. By default, the SSDM uses Email_Attachments as the folder path for oversized attachments.

[Exchange] PurgePABS=<#>

Type: boolean	Default: 0

> Purge PABS=1

... tells the SSDM to clear the contents of Personal Address Books in Exchange before migrating corresponding PABs from Notes—useful if, for example, you had already migrated PABs, but wanted to migrate them again. The default *PurgePABS=0* disables the feature, so no PABs are cleared. This feature clears only Exchange PABs that correspond to Notes PABs about to be migrated, and will not clear any other existing Exchange PABs.

[Exchange] RemigrateMode=<#>

keyword (single digit 0, 1 or 2)	Default: 1	New in ver 3.2

Tells the SSDM which of two methods to use, to avoid creating duplicate items in Exchange when an item that has already been migrated to Exchange is queued to migrate again. For example:

> RemigrateMode=0

... tells the wizard to delete the Exchange copy of the item and remigrate it from Notes.

The parameter value is a single-digit integer, which must be one of these three valid values:

> 0: Delete the Exchange copy of the item and remigrate it from Notes.

> 1 (default): the source item in Notes is be migrated, leaving the previously migrated copy not updated in Exchange.

> 2: If the source item in Notes was modified after a previous migration, delete the Exchange copy of the item and remigrate it from Notes. If the source item in Notes has not been modified, leave the previously migrated copy in Exchange.

The `RemigrateMode` parameter also impacts how folder permissions are migrated when a mailbox is migrated again. The following rules apply to the migration of folder permissions regardless of the `RemigrateMode` parameter setting and how many times the migration has been performed:

- Users who are listed in the Notes mail file ACL and are not already listed in the Exchange folder ACL list are added to the Exchange folders ACL list.

- Users who are listed in the Exchange folder ACL list and who are not listed in the Notes mail file ACL at all are not affected during the migration (i.e. their permissions are not revoked).

The `RemigrateMode` parameter affects the migration of folder permissions in scenarios where a user exists in both the Notes mail file ACL AND the Exchange Folder ACL. The `RemigrateMode` setting values affect the migration as described below:

> 0: Permissions for matching users are replaced. For example, if User X has Read/Write permissions in Exchange and Read permissions in Notes, the permissions for User X are updated from Read/Write to Read during the migration.

> 1 or 2: Permissions for matching users are not modified. For example, if User X has Read/Write permissions in Exchange and Read permissions in Notes, the permissions for UserX are not updated during the migration. The permissions remain as Read/Write.

[Exchange] RewriteRTF=<#>

Type: keyword	Default: 0

A single digit, 0–7, that specifies which (if any) of migrating mail, appointment and task items the SSDM should pass through Microsoft's rich-text converter—which in many cases will refine the exported compound document format from Notes' own converter. The parameter value must be one of these digits:

0: None	4: Tasks Only
1: Mail Only	5: Mail + Tasks
2: Appts Only	6: Appts + Tasks
3: Mail + Appts	7: Mail + Appts + Tasks

[Exchange] RootFolderAclMode=<#>

Type:	Default:	Occurs in:	New in:
integer	3	Data Migr	4.16.0

When migrating mailbox content, MNE also migrates mail file permissions to the folders within the target mailbox. The permissions are migrated to provide equivalent access in Exchange depending on the type of data contained within the folder. For example, mail folders are assigned permissions equivalent to the access granted to mail data in the source mail file.

Outlook provides a mechanism for opening up folders within other user's mailboxes. This mechanism only requires access to be granted on the specific folder being opened. For example, to view another mailbox's Inbox, a user only requires access to the Inbox within that mailbox. However, this mechanism is limited to specific well-known folders, such as the Inbox, Calendar, etc.

To browse other custom folders within another user's mailbox, you must add the target mailbox to the Outlook Profile. Browsing the folders in this manner only works if permissions are granted on the mailbox's root folder. Since the root folder does not contain any specific content, it is difficult to determine exactly what level of permissions to grant users on the root folder. There are pros and cons to each approach. This setting can be used to select the approach that is appropriate for each customer's needs. The following values are supported for this parameter.

- **None (0):** Don't migrate any permissions to the Root folder. Users can only open specific well-known folders in mailboxes to which they have access using the Outlook Open User's Folder feature.

- **Set Folder Visibility Only (1):** Users who have access to any kind of content within the Notes mail file are granted Folder Visibility rights on the root folder in the target mailbox. This allows users to browse the folder structure of the root folder. However, the users can only access the content of the child folders to which they've been granted access. The downside of this approach is that any folders that are created directly under the root folder after the migration inherit the permissions of the root folder. This could lead to some users having limited access to some of the content within the mailbox. For example, a user who should have access to email content would be able to access the mail folders that were created during migration, but would not have access

to the content of mail folders that were created after the migration. Conversely, users that have access to calendar/task/contact data only in the source mail file can view the folder structure of these newly created mail folders. However, they cannot view the content of these new mail folders.

- **Mail Folder Permission Only (2):** MNE configures the permission on the root folder to match all other mail folders (such as the Inbox). The advantage of this approach is that users who have access to email have all the access that they need in the target mailbox on folders that are created during the migration and also on folders that are created directly under the root folder after the migration (since those folders inherit their permissions from the root folder). The one disadvantage is that users who only have access to calendar/task/contact data can only access that data using Outlook's Open User's Folder feature. They cannot browse the mailbox content from the root folder.

- **Combined Permissions (3):** MNE combines the behavior of the previous two settings. Users who have access to mail content are granted equivalent access to the root folder. Users who have access to calendar/task/contact data are granted Folder Visibility permissions on the root folder. There are numerous benefits to this approach. All users who have access to any kind of content can browse the folders of the target mailbox from the root of the mailbox. Users with access to mail content are assured to have access to folders created during the migration and those that are created directly under the root folder after the migration. The one minor downside of this approach is that because folders that are created directly under the root folder after the migration inherit the permission of the root folder, users who have access to calendar/task/contact data are only granted Folder Visibility permissions on those folders. This does not grant these users access to the content within these folders. However, they can view the folder structure under these folders, granting them slightly more access than intended.

[Exchange] ServerMailResolveAttendees=<#>

Type: boolean	Default: 1

This setting applies to data being migrated to a server mailbox (either primary or archive). It tells the SSDM to do an Exchange GAL lookup of attendees of migrated items to retrieve their Exchange addresses. Successfully resolved attendees are migrated to the target using their Exchange addresses instead of their SMTP addresses. This is required for free-busy lookups to succeed.

This feature can be disabled by setting the parameter to 0.

[Exchange] SupportOversizedAttachmentsInLegacyOutlook=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.1

Tells the SSDM whether to migrate an oversized message attachment using a method that modern Outlook (Outlook 2016 or later) or an OWA client can render correctly or to revert to an attachment type that legacy Outlook 2013 or earlier can render.

The default value 0 migrates attachments for modern Outlook and value 1 migrates attachments in the way that legacy Outlook supports.

[Exchange] UpdateHtmlWithMismatchedCharset=<charset>

Type:	Default:	New in:
string	[none]	4.15.1

When migrating to on-premises Exchange or Microsoft 365 targets, MIME encoded HTML emails may not display correctly in the email client if there is a mismatch between the character encoding declared in the HEAD element of the HTML message and the character encoding declared in the MIME headers. When a mismatch occurs, the message displays as garbled text.

To correct this issue, enable the parameter by specifying the character set used by the HTML HEAD element that is causing a problem. For example:

```
UpdateHtmlWithMismatchedCharset=UTF-16
```

When the parameter is enabled, MNE checks for the character set in the HTML HEAD element and when found, the character set is replaced with the MIME header character set.

The parameter is disabled by default. Only enable the parameter if corrupted characters are observed in migrated messages.

ℹ | **NOTE:** If errors occur during the parsing of the HTML, NME migrates the message with no modification.

Example 1

`UpdateHtmlWithMismatchedCharset=UTF-16`

	MIME charset	**HEAD charset**
message 1	UTF-8	UTF-16 changed to UTF-8
message 2	UTF-8	US-ASCII (unchanged)

Example 2

`UpdateHtmlWithMismatchedCharset=US-ASCII`

	MIME charset	**HEAD charset**
message 1	UTF-8	UTF-16 (unchanged)
message 2	UTF-8	US-ASCII changed to UTF-8

[Exchange] UpdateHtmlWithMissingCharset=<#>

Type:	Default:		New in:
boolean	0		4.13

MIME encoded HTML emails often have the charset encoding declared in two places. The first is within the MIME headers and the second is within the HEAD element of the HTML message itself. With properly formatted emails, these two charset declarations are identical. Some HTML emails have been found where the charset declaration in the MIME headers and the charset declaration in the HTML message do not match. Typically in these cases, the HTML charset declaration is not in the HEAD element where it is expected, but instead it appears later in the document, possibly in the BODY element. While these emails may not be technically valid, they are still handled properly by most email clients.

A new behavior has been observed in Microsoft 365 where the Exchange server attempts to correct the discrepancy in the charset declarations by removing the HTML charset declaration that conflicts with the MIME header charset declaration, and inserting a new HTML charset declaration in the HEAD element that matches the charset of the MIME header. In these cases the charset declaration will no longer match the encoding of the HTML body and as a result, non-ASCII characters are corrupted in the rendering of the email message.

To correct this issue, enable the `UpdateHtmlWithMissingCharset` option. With this option enabled, MNE checks for the presence of a charset declaration in the HTML HEAD element during the migration process. If missing, NME inserts a charset declaration using the charset value from the MIME message header. While this charset declaration may not match the encoding of the message, it makes Microsoft 365 think that everything is proper, and prevents Microsoft 365 from removing the correct charset declaration that appears later in the document. The second charset declaration in the body overrides the newly inserted one that is declared in the HEAD element. As a result, the email message renders properly in the email client.

If any parsing errors occur during the parsing of the HTML, NME migrates the message with no modifications.

This option is off by default. This option adds some minimal overhead to the migration process. It should only be enabled if corrupted characters are observed in the migrated messages.

The issue has only been observed when migrating to Microsoft 365, but it could potentially be introduced in a later update to on-premises Exchange.

[Exchange] UseMneMapiHttpLib=<#>

Type:	Default:	Occurs in:	New in:
boolean	1	Data Migr	4.16.0

MNE no longer uses Outlook MAPI to write data to the target server mailbox. Quest has created its own library that implements Microsoft's MAPI/HTTP protocol. This library has many advantages over Outlook MAPI and it is now used in almost all migration scenarios that target server mailboxes.

There are limited scenarios where the MNE MAPI/HTTP library is not used:

- The migration target is Exchange 2010, which does not support the MAPI/HTTP protocol.

- The migration client is the SSDM and the client workstation does not have .NET runtime 4.5 (or later) installed.

Use this parameter to force MNE to revert back to using Outlook MAPI to perform the migration. Quest strongly recommends that customers not do this unless directed by Quest support personnel.

The parameter to use the MNE MAPI/HTTP library is enabled by default so parameters that use Outlook MAPI are not used during migration. The parameters that are only used by Outlook MAPI are as follows:

- `[Exchange] AutodiscoverPreferInternalRpcHttpUrl`

- `[Exchange] MAPIRetryCount`

- `[Exchange] MaxSessionReconnectCount`

- `[Exchange] MessageRetryCount`

[Filter] section

[Filter] AttachSize=<####>

Type: integer	Default: 20480 for O365 target, or otherwise none

This value specifies the max size limit for attachments—that is, the program will migrate only attachments that are smaller than the size designated here, in KB. For example: *AttachSize=8000* tells the program to not migrate attachments larger than 8000 KB.

[Filter] FirstCalDate=<mm/dd/yyyy>

Type: date	Default: [GUI entry]	New in ver 4.5

This value corresponds to a GUI element in the SSDM: the **Migrate only calendar data ... dated on or after** field in the *Select Date and Size Filters* screen, which specifies the earliest items that the program will migrate (will migrate only items that are timestamped on or after the designated date). The SSDM writes this value to the Task Parameters from the user's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] FirstDate=<mm/dd/yyyy>

Type: date	Default: NONE	New in ver 4.5

This parameter specifies the earliest items that the program will migrate (items that are timestamped on or after the designated date). When set to NONE, all mail and calendar items are migrated.

Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] FirstMailDate=<mm/dd/yyyy>

Type: date	Default: [GUI entry]	New in ver 4.5

This value corresponds to a GUI element in the SSDM: the **Migrate only messages ... dated on or after** field in the *Select Date and Size Filters* screen, which specifies the earliest items that the program will migrate (will migrate only items that are timestamped on or after the designated date). The SSDM writes this value to the Task Parameters from the user's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] LastCalDate=<mm/dd/yyyy>

Type: date	Default: [GUI entry]	New in ver 4.5

This value corresponds to a GUI element in the SSDM: the **Migrate only calendar data ... dated on or before** field in the *Select Date and Size Filters* screen, which specifies the latest items that the program will migrate (will migrate only items that are timestamped on or before the designated date). The SSDM writes this value to the Task Parameters from the user's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] LastDate=<mm/dd/yyyy>

Type: date	Default: NONE	New in ver 4.5

This parameter specifies the latest items that the program will migrate (items that are timestamped on or before the designated date). When set to NONE, all mail and calendar items are migrated.

Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filter] LastMailDate=<mm/dd/yyyy>

Type: date	Default: [GUI entry]	New in ver 4.5

This value corresponds to a GUI element in the SSDM: the **Migrate only messages ... dated on or before** field in the *Select Date and Size Filters* screen, which specifies the latest items that the program will migrate (will migrate only items that are timestamped on or before the designated date). The SSDM writes this value to the Task Parameters from the user's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Filters] section

[Filters]
Filter<#>=<FolderName>
Filter<#>=<ViewName>

Type:	Default:
string	none

Each line specifies a folder name. The specified folder is excluded from the migration. For example:

[Filters]

Filter0=Folder1

Filter1=Folder2

Folders can be included or excluded by setting `[Filters]`, `[FolderTreeFilters]`, and `[IncludeFoldersAndViews]`. The precedence order is `[Filters] > [IncludeFoldersAndViews] > [FolderTreeFilters]`.

- If a folder is named in both the `[Filters]` section and the `[IncludeFoldersAndViews]` section, the `[Filters]` section takes precedence and the folder or view is not migrated.

- If a folder is named in both the `[IncludeFoldersAndViews]` and the `[FolderTreeFilters]`, the `[IncludeFoldersAndViews]` sections take precedence and the folder or view is migrated. Since the `[FolderTreeFilters]` section impacts the sub folders, the sub folders are still excluded if they are not named in the `[IncludeFoldersAndViews]`.

[FolderTreeFilters] section

[FolderTreeFilters] Filter<#>=<FolderName>

Type:	Default:	New in:
string	none	4.15.2

Each line specifies a folder name. The specified folder and all sub folders are excluded from the migration. For example:

[FolderTreeFilters]

Filter0=Folder1\sub1

Filter1=Folder2\sub1

Folders can be included or excluded by setting `[Filters]`, `[FolderTreeFilters]`, and `[IncludeFoldersAndViews]`. The precedence order is `[Filters] > [IncludeFoldersAndViews] > [FolderTreeFilters]`.

- If a folder is named in both the `[Filters]` section and the `[IncludeFoldersAndViews]` section, the `[Filters]` section takes precedence and the folder or view is not migrated.

- If a folder is named in both the `[IncludeFoldersAndViews]` and the `[FolderTreeFilters]`, the `[IncludeFoldersAndViews]` sections take precedence and the folder or view is migrated. Since the `[FolderTreeFilters]` section impacts the sub folders, the sub folders are still excluded if they are not named in the `[IncludeFoldersAndViews]`.

[General] section

[General] ACLs=<#>

Type: boolean	Default: 1	Updated in: 4.10

    ACLs=0

... tells the program to not copy ACL information to Exchange during the migration. By default (*ACLs=1*) the program will copy ACL information and will set folder permissions in Exchange. *New in version 4.10:* The *ACLs* parameter now also determines whether PAB ACLs will be migrated. Prior to this enhancement, PAB ACLs were always migrated regardless of this *ACLs=<#>* setting.

[General] AddrBookErrors=<value>
[General] AddrBookWarnings=<value>

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

169

[General] AnyPst=<value>
[General] AppAborted=<value>

These are all internal scratch parameters (see Transient "scratch" parameters).

[General] AppDoesArch=<#>
[General] AppDoesEncrypted=<#>
[General] AppDoesMail=<#>
[General] AppDoesPabs=<#>

Type: boolean	Default: 1

Determines whether the corresponding migration option will be visible to the user on the *Specify Data for Migration* screen. The default *AppDoesXxxx=1* makes the option visible, while *AppDoesXxxx=0* makes the option invisible (unavailable to the user) on the screen and also:

- masks the portions of the *Welcome* and *Migration Report* screens that pertain to the hidden option; and

- disallows the migration of that data type regardless of other parameter settings (that is, this parameter would override *MigrateArchives=1*).

Note that these parameters do not set the marked-vs-unmarked status of the corresponding check boxes, although check box status can be controlled by the *MigrateXxxxxx* parameters. Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how this parameter relates to others used to customize the SSDM.

[General] ArchiveDest=<ValidKeyword>

Type:	Default:
keyword	PST

Specifies the destination for migrated archives. Valid values are "PST" or "server".

If ArchiveDest=server, the ArchiveDestServerArchive parameter (documented separately below) determines whether archives will be migrated to users' server-mail mailboxes or personal-archive mailboxes.

[General] ArchiveDestServerArchive=<#>

Type:	Default:	New in:
boolean	0	4.4.1

This parameter determines whether archives will be migrated to users' server-mail mailboxes (0) or personal-archive mailboxes (1). For example:

```
ArchiveDestServerArchive=1
```

… tells the wizard to migrate the user archives to the personal archive mailboxes. Note that this ArchiveDestServerArchive parameter is relevant only if ArchiveDest=server (as documented above).

If ArchiveDest=pst, this ArchiveDestServerArchive parameter is ignored.

[General] ArchiveErrors=<value>
[General] ArchiveWarnings=<value>

These are both internal scratch parameters (see Transient "scratch" parameters).

[General] AskFilter=<#>

Type: boolean	Default: 0

Enables/disables date filtering, to limit the items migrated by date: no earlier than, no later than, or both. By default this feature is disabled — that is, the date-filtering options will not be presented to the user. Note: To use date filters with the SSDM, you may need to register the *mscal.ocx* file.

[General] AttachmentFilteredbySizeMsg=<PathAndFilename>

Type: string	Default: [none]	New in ver 3.2.0

Specifies the path and filename of the text file (*.txt) that contains a customized message that the program should insert in place of any attachment that the program removes due to a size limitation. The program lets you specify a size limit for attachments in migrating messages, so the program removes any attachment that exceeds the limit and replaces it with an explanatory note in the message body. The program inserts a default explanatory note unless *UseFilteredAttachmentMsg=1* (see below), in which case the program inserts the customized message in the text file specified here. If *UseFilteredAttachmentMsg=0*, the program ignores this *AttachmentFilteredbySizeMsg* parameter. For example:

> AttachmentFilteredbySizeMsg=c:\temp\custom_msg.txt

... tells the program to insert the text contents of *c:\temp\custom_msg.txt* in place of the removed attachment whenever an attachment exceeds the size limit. This feature is also an option in the Data Migration Wizard (same parameter name in the same [General] section, but in the Global Defaults and Task Parameters).

[General] AttachmentLostDueToEncryptionMsg=<PathAndFilename>

Type: string	Default: [none]	New in ver 3.2.0

Specifies the path and filename of the text file (*.txt) that contains a customized message that the program should insert in place of an attachment to a migrated encrypted message. When an encrypted message is migrated, the attachment is removed and replaced by an explanatory note. The program will insert a default explanatory note unless *UseFilteredAttachmentMsg=1* (see below), in which case the program will insert the customized message drawn from the text file specified here. If *UseFilteredAttachmentMsg=0*, the program will ignore this *AttachmentLostDueToEncryptionMsg* parameter. For example:

> AttachmentLostDueToEncryptionMsg=c:\temp\custom_msg.txt

... tells the program to insert the contents of *c:\temp\custom_msg.txt* in place of the removed attachment in each migrated encrypted message. This feature is also an option in the Data Migration Wizard (same parameter name in the same section, but in the Global Defaults and Task Parameters).

[General] BodyLostDueToEncryptionMsg=<PathAndFilename>

Type: string	Default: [none]	New in ver 3.2.0

Specifies the path and filename of the text file (*.txt) that contains a customized message that the program should insert in place of the encrypted body of a migrated encrypted message. When an encrypted message is migrated, the encrypted message text is removed from the message body, but is replaced by an explanatory note. The program will insert a default message unless *UseFilteredBodyMsg=1* (see below), in which case the program will insert the customized message drawn from the text file specified here. If *UseFilteredBodyMsg=0*, the program will ignore this *BodyLostDueToEncryptionMsg* parameter. For example:

> BodyLostDueToEncryptionMsg=c:\temp\custom_message.txt

... tells the program to insert the contents of *c:\temp\custom_message.txt* in place of the removed message body in each migrated encrypted message. This feature is also an option in the Data Migration Wizard (same parameter name in the same section, but in the Global Defaults and Task Parameters).

[General] CompressLogFile=<#>

Type: boolean	Default: 0	New in ver 3.2

Tells the program whether to compress its log file. A compressed log file saves disk space, and is viewable by Quest's Log Viewer utility, but is not a generic text file that can be viewed in Notepad or Word. This is a binary parameter; the only valid values are 0 (off) or 1 (on). For example: *CompressLogFile=1* tells the program to compress the file.

[General] ContactDisplayNameFormat=<#>

Type:	Default:	New in
keyword (single digit 0, 1, 2, or 3)	1	4.14.1

Determines how contacts are displayed in Outlook. The options for this setting are:

- 0 – Use Legacy Naming – Contacts are named using the first value from the Notes Full Name field which does not start with "CN=". This is how contacts were named in all versions of Migrator for Notes to Exchange prior to version 4.14.1.179.

- 1 (Default) – Use the Notes contact's display name – Create the display name using the format specified by the contact's **View display name format** setting in Notes.

- 2 – Create the display name as **FirstName LastName**. The middle name and name suffix are included, if present.

- 3 – Create the display name as **LastName, FirstName**. The middle name is included, if present.

[General] ContactsName=<MigratedFolderName>

Type: string	Default: Notes

Determines how the user's Contacts folder will be named. For example: *ContactsName=MyContacts* tells the program to name the Contacts folder "MyContacts."

[General] CurArchiveDir=<Path>

Type: string	Default: [none]

Identifies the root of the source subtree the program will scan to find archive .nsf files for migration. For example: *CurArchiveDir=c:\notes\data\archive* tells the program to look for archive .nsf files in *c:\lotus\notes\data\archive*, and in all subfolders thereunder. Environment variables may be included in the path.

[General] CurMailFileDir=<Path>

Type: string	Default: [none]

Identifies the root of the source subtree the program will scan to find mail .nsf files for migration. For example: *CurArchiveDir=c:\lotus\notes\data\mail* tells the program to look for mail .nsf files in *c:\lotus\notes\data\mail*, and in all subfolders thereunder.

[General] DeferredMailDate=<mm/dd/yyyy>

Type:	Default:	New in:
date	now	4.16.0

This parameter supports the Domino feature that allows you to schedule messages to be sent on a specific date and time. After migration, Exchange or Exchange Online will not send the deferred messages.

Specifies the earliest date that deferred emails (sent items that are timestamped on or after that date) will be written to a log file (named XXX-DeferredEmails.tsv) located in the SSDM log folder. If the parameter is not set, only deferred messages that have a date after NOW are written to the log file. If you plan to shut down the Domino server on a specific day after the migration, it is recommended that you set the parameter to be on or before that day. This provides you with a list of deferred emails that were not delivered by Domino.

[General] DisableDebugPool=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	All logging applications and Log Viewer	4.15.2

Specifies if the program caches and writes out 128 DEBUG log lines before a WARNING or ERROR when LogLevel is less than or equal to 2. When LogLevel equals 3, the debug log is always written out.

When set to the default value (0), the debug pool is enabled and the program caches up to 128 DEBUG log lines. The program writes out the previous 128 DEBUG log lines when it meets a WARNING or ERROR.

Set `DisableDebugPool=1` if you don't want the previous DEBUG log to be written out before a WARNING or ERROR when LogLevel is less than or equal to 2.

[General] DisplayLanguage=<LanguageCode>

Type: string	Default: [none]

By default, the SSDM interface and help are displayed in the language specified in the operating system settings (language and locale). You can use the `DisplayLanguage` parameter to specify a language.

The `<LanguageCode>` specified must be either the two letter code defined by ISO 639-1 or the three letter code defined by ISO 639-2. For example, the two letter code for French is **fr** and the three letter code is **fra**.

If an unsupported language is specified:

- The SSDM checks the operating system settings and displays in that language, if supported.

- If the operating system language is not supported, the SSDM displays in English.

Currently, SSDM supports English and French.

[General] EncryptedPstFileName=<filename.pst>

Type: string	Default: [null]	New in ver 4.12.1

Tells the SSDM to migrate encrypted Notes messages to a separate PST file in Outlook, no matter how many *source.nsf* files are selected for the migration, and specifies the full filename and extension for the target PST file. In any subsequent SSDM runs, the program will preserve the earlier PST files and automatically append a digit to the designated filename to differentiate it from previously migrated PSTs (*filename.pst*, *filename_1.pst*, *filename_2.pst*, etc.).

The default is [null], which effectively disables the feature so that encrypted messages are sent to the same PST files as all other (unencrypted) migrated items.

Note that this feature is enabled only when all migrated items are directed to PSTs by:

> [General]
> ServerMailDest=PST
> ArchiveDest=PST
> PABDest=PST

If any of those item types is directed to a non-PST destination, the *EncryptedPstFileName* parameter is ignored.

[General] EndUserStatsDir=<UNCPathSpecification>

Type: string	Default: [GUI entry]

This value corresponds to a GUI element in the Notes Migration Manager: the **End-User statistics directory** text box in the *Gather End-User Statistics* screen. The program writes this value to *notesdtapp.ini* from the GUI entry in NMM; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[General] FileAsFormat=<ValidKeyword>

Type:	Default:
keyword	*Same*

This value corresponds to a GUI element in the Data Migration Wizard, the Set contact 'File as' to drop-down listbox in the *Specify Data for Migration* screen. The wizard writes this value to the Task Parameters from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The FileAsFormat parameter determines the format of the contact's **File As** attribute in Exchange. The **File As** attribute is used by Outlook to alphabetize your contacts. The options for this setting are:

- **Same:** Use the Display Name attribute of the address book entry. By default Migrator for Notes to Exchange migrates contacts using display names that match the display name of the contact in Notes, however the contact's display format can be modified using the `[General] ContactDisplayNameFormat` parameter.

- **FirstLast:** Create the **File As** using the first name and last name attributes separated by a space. The middle name and name suffix are included, if present.

- **LastFirst:** Create the **File As** using the last name and first name attributes separated by a comma. The middle name is included, if present.

[General] ForceAddrBook<#>=<PathAndFilename>

Type: string	Default: [none]

Identifies the source (Notes) location and filename of an address book to be migrated. The program ordinarily prompts the user for this information during a program run, but the information must be specified in advance by this parameter if the program will run in silent mode.

You may define one or more address books to be migrated. The digit(s) appended to a *ForceAddrBook<#>* key name differentiate one parameter from another. Multiple *ForceAddrBook<#>* parameters need not appear in numerical order, but must begin with 0 and must fill a numeric sequence. For example:

        ForceAddrBook0=c:\notes\data\names0.nsf
        ForceAddrBook1=c:\notes\data\names1.nsf
        ForceAddrBook2=c:\notes\data\names2.nsf
        ForceAddrBook3=c:\notes\data\names3.nsf

The number of *ForceAddrBook<#>* parameters must be specified by *ForceAddrBooks* parameter, also in this [General] section and described separately below.

[General] ForceAddrBooks=<##>

Type: integer	Default: 0

Defines the number of *ForceAddrBook<#>* parameters (see above) that the program will process. For example:

        ForceAddrBooks=3
        ForceAddrBook0=c:\notes\data\names0.nsf
        ForceAddrBook1=c:\notes\data\names1.nsf
        ForceAddrBook2=c:\notes\data\names2.nsf

[General] HTMLdoclinks=<#>

Type:	Default:	New in:
keyword (single digit 0, 1, 2 or 3)	3	3.2

Tells the SSDM to migrate Notes DocLinks to Exchange in a particular link format. For example:

> HTMLdoclinks=1

... tells the wizard to migrate DocLinks to Exchange as HTML-style links. Valid parameter values are:

> 0: Migrate DocLinks as Notes-style DocLinks (NDL files), which can be opened in Exchange only if a Notes client is installed on the client workstation.

> 1: Migrate DocLinks to Exchange as HTML-style links, which can be opened in a web browser if the user is able to use iNotes.

> 2: Migrate DocLinks in the Notes Migrator for SharePoint format. In this case you must also use the *SharePointServerName* parameter (also in this [General] section) to specify the name of the server where the linked documents reside. (This SharePoint format option added in ver 4.1.2.)

> 3 (default): Migrate DocLinks to Exchange as Notes links (which will require a Notes client running on end users' desktops to facilitate the rendering of the Notes documents).

For an off-line migration, this parameter must be set to *HTMLdoclinks=0*.

[General] IncludeServerMailFile=<#>

Type: boolean	Default: 1

Determines whether the program will attempt to connect to the Notes server to display the server mail file within the list of available mail files. For example:

> IncludeServerMailFile=0

... tells the program to not connect to the Notes server, but to offer only local mail file replicas. By default (*IncludeServerMailFile=1*), the program will attempt to connect to the Notes server and will display a list of any local mail file replicas and the server mail file that it finds.

[General] KeyError=<value>

Internal scratch parameter (see Transient "scratch" parameters).

[General] LanguageCode=<SECTIONNAME>

Type:	Default:	New in:
string	*[null]*	4.12.0

Specifies which set of folder names should be used when assigning folder names to Outlook PST and personal archive folders. The wizard's Task Parameters may contain several sets of PST and personal archive folder names for different locales, differentiated by different [SECTIONNAME]s for the different locales. This parameter simply specifies the name of the locale section that contains the locale-specific PST and personal archive folder names you want the wizard to use for this purpose:

> [General]
> LanguageCode=<SECTIONNAME>

The default is *null*, in which case the wizard uses the section associated with the system locale (of the computer running the wizard). But if (for example) *LanguageCode=DE*, the wizard will use the PST and personal archive folder names defined in the [DE] section of the Task Parameters. Note that there must exist a language section in the Global Defaults to support the SECTIONNAME you specify.

[General] LogDir=<Path>

Type: string	Default: %temp%	New in ver 3.2

Tells the program where to write its log file. The parameter can specify either a UNC shared directory or a local drive. For example:

>   LogDir=\\server\share\

... tells the program to write its log file to the *\\server\share* folder. By default, if the parameter is unspecified in the INI file, the program will write its log file as *notesdtapp.wlog* to whatever path is associated with the *%temp%* environment variable. If some other path is specified by this parameter, the filename will be: *COMPUTERNAME-yyyymmdd-hhmmss.wlog*

[General] LogLevel=<#>

Type: keyword (single digit 0, 1, 2 or 3)	Default: 2

Specifies how much detail the program will include in its run logs. The default value 2 is suitable for most routine production runs. If you need to diagnose a problem, set the value to 3 (verbose): *LogLevel=3*

[General] MaxFolderCache=<#######>

Type: integer	Default: 450

Specifies the number of folders to cache before flushing the cache. Exchange limits the number of objects that can be open at one time. The limit for folders is 500, so if a user has more than 500 folders, the default setting of *MaxFolderCache=450* tells the SSDM to flush the cache at 450, so that all folders will migrate.

Valid values are $0 \leq x \leq max$, where the maximum value is one less than the max folder count that is configured on your Exchange server in the registry settings. See this Microsoft article.

If this cache flush feature is turned off (by *MaxFolderCache=0*, so that the cache is unlimited), and a user has more than 500 folders, the folders will not be created, and the SSDM will note an error in the log.

[General] MaxLargePstSize=<########>

Type: integer	Default: 20480

Specifies the maximum size (in MBs) of large PSTs (Outlook 2003 or later Unicode PST files), beyond which the SSDM will split the file into two or more files. This parameter is ignored for users running Outlook 2002 or earlier. Valid values are $0 \leq x \leq 51200$ for Outlook 2010, or $0 \leq x \leq 20480$ for earlier Outlook versions. (Pre-2010 versions of Outlook cannot open a file larger than 20 MB.) For example: *MaxLargePstSize=40960*

[General] MaxPstSize=<#######>

Type: integer	Default: 2048

Specifies the maximum size (in MBs) of PSTs (for Outlook 2002 and earlier PST files), beyond which the SSDM will split the file into two or more files. Valid values are $0 \leq x \leq 2048$.

[General] MergeAddressBookFolder=<FolderName>

Type: string	Default: Contacts

The name of the single folder to which the SSDM will merge all migrated address books, if you want to migrate them to a folder other than the default Contacts folder. For example: *MergeAddressBookFolder=AllContacts*. This parameter is ignored if *MergeAddressBooks=0*.

[General] MergeAddressBooks=<#>

Type: boolean	Default: 1

    MergeAddressBooks=1

... tells the program to merge all migrated address books into the single Contacts folder, or into a single folder as named by the *MergeAddressBookFolder* parameter (see above). If using the option *MergeAddressBooks=0*, the program will migrate different address books to different folders, one folder per address book.

[General] MigrateArchives=<#>
[General] MigratePAB=<#>
[General] MigrateServerMail=<#>

Type: boolean	Default: 0

For each parameter, a setting of 1 tells the program to migrate the item type (Archives, PABs or ServerMail) if the *Specify Data for Migration* screen does not appear, or sets the associated check box in that screen to be marked by default. For example: *MigrateArchives=1* tells the SSDM to migrate archives if the *Specify Data for Migration* screen does not appear, or sets the **Migrate archive** check box in that screen to be marked by default.

A value of 0 tells the program to not migrate the item type (Archives, PABs or ServerMail), or sets the associated check box to be unmarked by default. A *MigrateXxxxx* parameter is ignored if its associated *AppDoesXxxx=0*. The most common use of these parameters is to provide the necessary entry values when the program is configured to hide the *Specify Data* screen. Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how these parameters relate to others used to customize the SSDM.

[General] MigrateRecentContacts

Type:	Default:		New in:
boolean	1		4.7

`MigrateRecentContacts=1` tells the wizard/SSDM to migrate the PABs' Recent Contacts list to the folder specified by the `RecentContactsFolder` parameter.

[General] MigrateRecurringBeforeRange=<#>

Type: boolean	Default: 0	New in ver 4.1.5

Determines whether the program will (1) or will not (0) migrate all instances of a recurring appointment or task when the first instance occurs prior to the range of a specified date filter (if any has been defined), but the last instance occurs within or after the date filter range. For example, if a date filter had been defined to migrate only mail and calendar items from October 10 through 25, and a recurring weekly appointment or task has been defined to run three weeks beginning October 1 (so appointments occur on October 1, 8 and 15), then:

    MigrateRecurringBeforeRange=1

… would tell the program to migrate all three instances of the series. Likewise, if the same October 10-25 date filter were defined, and a recurring weekly appointment spanned five weeks beginning October 1 (for instances on October 1, 8, 15, 22 and 29), *MigrateRecurringBeforeRange=1* would tell the program to migrate all five instances.

If *MigrateRecurringBeforeRange=0*, none of the instances of a recurring appointment or task are migrated if the first instance of the series occurs prior to the range of a defined date filter.

[General] NeedUpgradeTemplate=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.0

When set to (1), the MNE console navigation drawer displays the option **Upgrade Templates**. When selected, MNE upgrades all the full templates in the database to differential templates. Differential templates pick up changes made to the Global Default settings.

After the templates have been upgraded, the parameter is set to (0). You should not configure this parameter directly, it is set by program.

[General] PABDest=<ValidKeyword>

Type:	Default:	Occurs in:
keyword	server	Data Migr

The destination for migrated Personal Address Books data. Valid values are "PST" or "server". For example:

    PABDest=PST

If PABDest=server, the *PABDestServerArchive* parameter (documented separately below) determines whether PABs will be migrated to users' server-mail mailboxes or personal-archive mailboxes.

[General] PABDestServerArchive=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.4.1

This parameter determines whether PABs will be migrated to users' server-mail mailboxes (0) or personal-archive mailboxes (1). For example: *PABDestServerArchive=1* tells the wizard to migrate users' PABs to their personal-archive mailboxes. Note that this *PABDestServerArchive* parameter is relevant only if *PABDest=server* (as documented above). If *PABDest=pst*, this *PABDestServerArchive* parameter is ignored.

[General] PostLogs=<#>

Type: boolean	Default: 1

This value is derived from a GUI element in the Notes Migration Manager: the **Post user logs to the central directory** check box in the S*hared Directories Configuration* screen. The NMM program writes the value to this *PostLogs* parameter, in addition to a corresponding *PostLogs* parameter in its own NMM Task Parameters. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value here determines whether the SSDM will copy its log files from the users' local temp directories to the centralized directory specified in the NMM. The option is on by default (*PostLogs=1*). The alternative, *PostLogs=0*, tells the Desktop Migrator to write its log files only to individual users' local temp directories, and not copy them to the centralized directory.

[General] PromptUpgradeTemplate=<#>

Type:	Default:	Occurs in:	New in:
boolean	0	Data Migr	4.16.0

When set to (1), MNE prompts the user to upgrades all the full templates in the database to differential templates when the MNE console is launched. Differential templates pick up changes made to the Global Default settings.

After the templates have been upgraded or the customer selects "Don't ask me again", the parameter is set to (0). You should not configure this parameter directly, it is set by program.

[General] RecentContactsFolder

Type:	Default:	New in:
string	Recent Contacts	4.7

Specifies the name of the folder to which the PAB's Recent Contacts list will be migrated. This parameter is ignored if `MigrateRecentContacts=0`.

[General] ReportErrors=<#>

Type: boolean	Default: 1	New in ver 4.1.5

Determines whether the SSDM *Finished* screen will display the app's statistics, and the **View Errors** button. For example: *ReportErrors=0* tells the SSDM to not report its counts of errors, warnings, filters and skips on the *Finished* screen, and to not offer the **View Errors** button.

[General] reportMofN=<#>

Type: boolean	Default: 1	New in ver 4.0.0

Determines whether the SSDM will display the total number of items to be processed in the item count on its *Progress* screen. For example: *reportMofN=0* tells the program to display "Processed M item(s)" instead of the default (1) "Processed M of N item(s)."

[General] reportPct=<#>

Type: boolean	Default: 1	New in ver 4.0.0

Determines whether the SSDM will display item-count estimates in the title and progress bar on its *Progress* screen. For example: *reportPct=0* tells the program to not update the title, and to suppress the percent value in the progress bar.

[General] SelectedAddrBook<#>=<PathAndFilename>

Type: string	Default: [GUI entry]

These parameters correspond to a GUI element in the SSDM: the **Select address books...** check box(es) in the *Select Notes Address Books to Migrate* screen. Each *SelectedAddrBook<#>* parameter specifies the path and filename of an address book to be migrated. The program writes these values to the *notesdtapp.ini* file from an admin's GUI selection(s); Quest recommends you do not enter or change these parameter values except at the explicit direction of Quest Support staff.

The digit(s) appended to a *SelectedAddrBook<#>* key name differentiate one parameter from another. Multiple *SelectedAddrBook<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. But the program will read only *SelectedAddrBook<#>* parameters whose differentiating digits are less than a value specified by a *TotalSelAddrBooks* parameter in the same [General] section. See the *TotalSelAddrBooks* parameter below for more information. For example:

```
[General]
TotalSelAddrBooks=4
SelectedAddrBook0=C:\Program Files (x86)\IBM\Notes\Data\names0.nsf
SelectedAddrBook1=C:\Program Files (x86)\IBM\Notes\Data\names1.nsf
SelectedAddrBook2=C:\Program Files (x86)\IBM\Notes\Data\names2.nsf
SelectedAddrBook3=C:\Program Files (x86)\IBM\Notes\Data\names3.nsf
```

[General] SelectedArchive<#>=<PathAndFilename>

Type: string	Default: [GUI entry]

Each *SelectedArchive<#>* parameter specifies the path and filename of an archive to be migrated. These parameters are ignored if the SSDM displays its *Select Notes Archive Files to Migrate* screen, in which case the user's GUI entries determine the program behavior. (That screen will not appear if *SelectArchive=silent*. If *SelectArchive=skip*, the SSDM will display the screen only if no *SelectedArchive<#>* parameter is specified in the Task Parameters.)

The digit(s) appended to a *SelectedArchive<#>* key name differentiate one parameter from another. Multiple *SelectedArchive<#>* parameters need not appear in numerical order, and need not form an uninterrupted numeric sequence. But the program will read only *SelectedArchive<#>* parameters whose differentiating digits are less than a value specified by a *TotalSelArchives* parameter in the first line of the same section. See the *TotalSelArchives* parameter below for more information. For example:

```
[General]
TotalSelArchives=3
SelectedArchive0=\\server\folder\arch0.nsf
SelectedArchive1=\\server\folder\arch1.nsf
SelectedArchive2=\\server\folder\arch2.nsf
```

[General] SelectedMailbox=<MailboxName>

Type: string	Default: [none]

If MNE finds more than one mailbox in the selected Outlook profile, MNE displays a *Select Mailbox* screen to prompt the user to designate the target mailbox. The SSDM can be configured to skip the *Select Mailbox* screen, but in that case (and if more than one mailbox is associated with the selected Outlook profile) the program must be able to determine the correct mailbox to use. Use this parameter to specify the user's target mailbox. For example:

```
SelectedMailbox=John Smith
```

Specifying the target mailbox in the INI file will be useful only if:

- all users who will run the program with that INI file will have the same mailbox name (for example, some generic name like "My Mailbox," although each user's mailbox resides on his/her own local workstation and is independent of other users' mailboxes); or

- a different INI file is prepared for each individual user's run of the end-user program, so that individual mailboxes can be specified.

The SSDM does not need this *MailboxName* value if one and only one mailbox will be found in the user's Outlook profile.

[General] SelectedMailFile=<filename.nsf>

Type: string	Default: [GUI entry]

This value corresponds to a GUI element in the SSDM: the **Select mail file...** check box(es) in the *Select Notes Local Mail File Replica to Migrate* screen. The program writes this value to the *notesdtapp.ini* file from an admin's GUI entry; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value consists of a filename designated in the GUI by its marked check box. For example: *SelectedMailFile=filename.nsf*

If more than one check box is marked in the screen, only the last filename marked in the list will appear as the value of this parameter. The file resides in the path designated in the **Specify directory...** text box on the same screen.

[General] SelectedProfile=<ProfileName>

Type: string	Default: [none]

Specifies the Outlook profile to which the program will migrate data. For example: *SelectedProfile=Joel Brennen*

The program will need this *SelectedProfile* parameter only if more than one eligible profile will be found on any user's workstation. Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how this parameter relates to others used to customize the SSDM.

[General] SelectedPstDir=<path>

Type: string	Default: [*Outlook default directory*]

Specifies the destination folder (path) for the user's migrated archive. The *<path>* is specified as a full UNC or mapped-drive path (without filename) relative to the user's computer. For example:

> SelectedPstDir=c:\Program Files\Outlook\Archive

Environment variables may be included in the path.

The default is the Outlook Default Directory, which the program can determine from its operating environment. This parameter is therefore necessary only if you want users' migrated archives to go somewhere other than the Default Directory. Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how this parameter relates to others used to customize the SSDM.

[General] SendStatus=<#>

Type: boolean	Default: 1	Revised in ver 4.0

This value is derived from a GUI element in the Notes Migration Manager: the **Post user logs to the central directory** check box in the *Shared Directories Configuration* screen. The NMM program writes the value to this *SendStatus* parameter, in addition to the *PostLogs* parameter in its own NMM Task Parameters, and another *PostLogs* parameter in this same [General] section of *notesdtapp.ini*. Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

The parameter value tells the Desktop Migrator whether to write a statistics file (a separate stats file per program run) in the centralized directory specified for log files in the NMM. The option is on by default (*SendStatus=1*), but *SendStatus=0* tells the program to not write any stats files.

[General] ServerMailDest=<ValidKeyword>

Type:	Default:
keyword	server

Sets the destination for migrated server mail. Valid values are "PST" or "server". For example:

> ServerMailDest=PST

If *ServerMailDest=server*, the *ServerMailDestServerArchive* parameter (documented separately below) determines whether server mail will be migrated to users' server-mail mailboxes or personal-archive mailboxes.

[General] ServerMailDestServerArchive=<#>

Type:	Default:	New in:
boolean	0	4.4.1

This parameter determines whether server mail will be migrated to the users' server-mail mailboxes (0) or personal-archive mailboxes (1). For example: *ServerMailDestServerArchive=1* tells the wizard to migrate users' server mail to their personal-archive mailboxes.

Note that this *ServerMailDestServerArchive* parameter is relevant only if *ServerMailDest=server* (as documented above). If *ServerMailDest=pst*, this *ServerMailDestServerArchive* parameter is ignored.

[General] ServerMailErrors=<value>
[General] ServerMailWarnings=<value>

Internal scratch parameter (see Transient "scratch" parameters).

[General] SharePointServerName=<ServerName>

Type: string	Default: [none]

Specifies the name of the SharePoint server where the Proposion-linked documents reside, if *HTMLdoclinks=2* (in this same [General] section). For example: *SharePointServerName=Banff*

[General] ShowSSDMErrorLogButton=<#>

Type: boolean	Default: 1	New in ver 4.12.1

Determines whether the SSDM will show or hide the **Error Log Report** button on the last SSDM end-user screen. The button is enabled (1) by default. Disabling the button may be useful in some environments where accessing a large log file might cause a user desktop to hang.

[General] SkipOutOfRangeExceptions=<#>

Type: boolean	Default: 0	New in ver 4.1.5

Determines whether the SSDM will (0) or will not (1) migrate an exception to a recurring appointment or task when the original or rescheduled start time falls outside the range of a defined date filter (if any). This parameter does not control whether such an instance would be migrated at all, but only whether the instance would be migrated as originally scheduled, or as it was changed. If, for example:

    SkipOutOfRangeExceptions=1

… and one instance of a recurring series was originally scheduled for October 1 but had been changed to October 2, and if that instance occurs outside a defined date filter range, the SSDM skips the exception—i.e., will migrate the instance at its original October 1 time rather than as changed, to October 2. If *SkipOutOfRangeExceptions=0* (default), the SSDM would migrate the instance as changed, for October 2.

[General] SMTPTranslationTable=<PathAndFilename>

Type: string	Default: [none]

Specifies the path and filename of the SMTP Translation Table: a data file generated by the Directory Export Wizard and used by other Quest applications and wizards to convert addresses in messages, address books, and contacts to the appropriate Internet (SMTP) address for each user. The Directory Export Wizard writes this value to the Task Parameters automatically; Quest recommends you do not enter or change this value except at the explicit direction of Quest Support.

[General] TotalErrors=<###>

Internal scratch parameter (see Transient "scratch" parameters).

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

182

[General] TotalSelAddrBooks=<##>

Type: integer	Default: [none]

A limit to the number of *SelectedAddrBook<#>* parameters (see above) that the SSDM will process in this section. The program will read only *SelectedAddrBook<#>* parameters whose differentiating digits are less than the parameter value specified here. For example, if:

```
[General]
TotalSelAddrBooks=4
SelectedAddrBook0=C:\Program Files (x86)\IBM\Notes\Data\names0.nsf
SelectedAddrBook1=C:\Program Files (x86)\IBM\Notes\Data\names1.nsf
SelectedAddrBook2=C:\Program Files (x86)\IBM\Notes\Data\names2.nsf
SelectedAddrBook3=C:\Program Files (x86)\IBM\Notes\Data\names3.nsf
SelectedAddrBook4=c:\program files\lotus\notes\data\names4.nsf
SelectedAddrBook5=c:\program files\lotus\notes\data\names5.nsf
```

... the program will migrate all the address books except *SelectedAddrBook4* and *SelectedAddrBook5*, since *TotalSelAddrBooks=4*, and neither 4 nor 5 is less than 4. If unspecified, the *TotalSelAddrBooks* parameter defaults to 0. If specified, the parameter must occur as the first line of the section, as shown above.

[General] TotalSelArchives=<#>

Type: integer	Default: 0

A limit to the number of *SelectedArchive<#>* parameters (see above) that the program will process in this section. The program will read only *SelectedArchive<#>* parameters whose differentiating digits are less than the *TotalSelArchives* value specified here. For example, if:

```
[General]
TotalSelArchives=3
SelectedArchive0=\\server\folder\arch0.nsf
SelectedArchive1=\\server\folder\arch1.nsf
SelectedArchive2=\\server\folder\arch2.nsf
SelectedArchive3=\\server\folder\arch3.nsf
SelectedArchive4=\\server\folder\arch4.nsf
```

... the program will read all the parameters except *SelectedArchive3* and *SelectedArchive4*, since *TotalSelArchives=3*, and neither 3 nor 4 is less than 3.

If unspecified, the *TotalSelArchives* parameter defaults to 0. If specified, the parameter must occur as the first line of the section, as shown above.

[General] TotalSelMailFiles=<#>

Type: integer	Default: 1

The number of mail files to be migrated. This value is derived from an administrator's selection for the **Select mail file...** check box(es) in the *Select Notes Local Mail File Replica to Migrate* screen. Since the program does not permit the migration of more than one mail file per program run, this parameter is always set to:

```
TotalSelMailFiles=1
```

[General] TotalWarnings=<###>

Internal scratch parameter (see Transient "scratch" parameters).

[General] UseFilteredAttachmentMsg=<#>

Type: boolean	Default: 0	New in ver 3.2.0

Determines whether the program will insert a default message (0) or a customized message (1) to replace an attachment that the program removes from a migrating message because it is encrypted or because the attachment exceeds a size limit. The program removes such an attachment from a message, and replaces it with an explanatory note. The explanatory note can be either a default explanation, or some customized message from a text file specified by a separate parameter (either *AttachmentLostDueToEncryptionMsg* or *AttachmentFilteredbySizeMsg*, as described above).

For example: *UseFilteredAttachmentMsg=1* tells the program to insert the customized message. This feature is also an option in the Data Migration Wizard (same parameter name in same section, but in the Global Defaults and Task Parameters).

[General] UseFilteredBodyMsg=<#>

Type: boolean	Default: 0	New in ver 3.2.0

Determines whether the program will insert a default message or a customized message to replace the encrypted body of a migrated encrypted message. The program removes the message body from every encrypted message it migrates, and replaces it with an explanatory note. The explanatory note can be either the default ("An encrypted bodypart was discarded"), or some customized message from a text file specified by the separate *BodyLostDueToEncryptionMsg* parameter (see above).

For example: *UseFilteredBodyMsg=1* tells the program to insert the customized message. This feature is also an option in the Data Migration Wizard (same parameter name in same section, but in Global Defaults and Task Parameters).

[General] UseLargePsts=<#>

Type: boolean	Default: 1

    UseLargePsts=0

... forces the program to not use large PSTs, whereas by default (1) the program will use large PSTs if possible. Note: A setting of 1 will not force Unicode PSTs if Outlook 2003 or later is not installed. The program cannot create PSTs without the proper MAPI components (from Outlook 2003 or later) in place.

[General] UserCancelled=<value>

Internal scratch parameter (see Transient "scratch" parameters).

[General] UseSeparatePSTS=<#>

Type: boolean	Default: 1

Determines whether the SSDM will migrate all data into a single pst file per user (0), or to multiple psts (1, the default).

[IncludeFoldersAndViews] section

[IncludeFoldersAndViews]
Include<#>=<FolderName>
Include<#>=<ViewName>

Type:	Default:	New in:
string	none	4.15

Each line specifies a folder or view name. The specified folder or view is included with the migration. For example:

[IncludeFoldersAndViews]

Include0=My Folder

Include1=My View

Folders can be included or excluded by setting `[Filters]`, `[FolderTreeFilters]`, and `[IncludeFoldersAndViews]`. The precedence order is `[Filters] > [IncludeFoldersAndViews] > [FolderTreeFilters]`.

- If a folder is named in both the `[Filters]` section and the `[IncludeFoldersAndViews]` section, the `[Filters]` section takes precedence and the folder or view is not migrated.

- If a folder is named in both the `[IncludeFoldersAndViews]` and the `[FolderTreeFilters]`, the `[IncludeFoldersAndViews]` sections take precedence and the folder or view is migrated. Since the `[FolderTreeFilters]` section impacts the sub folders, the sub folders are still excluded if they are not named in the `[IncludeFoldersAndViews]`.

[Notes] section

[Notes] ActiveMailTypes

Type:	Default:	New in:
integer	31	4.11

When Active Mail Processing is enabled, this parameter determines what type of Active Mail should be processed. This parameter is implemented as a set of bit flags where each bit corresponds with a specific type of active mail to be processed. The following bit values are supported:

- 1 – Notes Encrypted Mail

- 2 – Stored forms (created in Notes with Store form in document)

- 4 – Embedded buttons, hotspots, collapsible sections, etc.

- 8 – Unsupported Rich Text Elements

- 16 – Messages that are missing the "Form" field

- 32 – Dropdown sections

The default value for this parameter is 31, meaning that when Active Mail Processing is enabled, MNE will process all types of active mail except for dropdown sections.

The Migration Wizard includes a configuration dialog where the active mail types can be configured. However, it only includes check boxes for the first four types, allowing you to disable one or more of these types of active mail. To disable active mail processing of Missing Form Field messages, or to enable the processing of messages with dropdown sections, the `ActiveMailTypes` setting must be manually configured in the Default Global Settings.

For example, to configure MNE to process all types of active mail, add the following setting to the default global settings:

```
[Notes]
ActiveMailTypes=63
```

[Notes] ApplyFilterToOrphanedMessages = <#>

Type:	Default:	New in:
boolean	1	4.13.1

Determines if the migration of orphaned messages will use the Date/Time filters defined in the Migrate Data Wizard, in addition to the *MailAndCalQueryFilter* parameter. Note that this parameter is ignored if the *MigrateOrphanedDocs* parameter is turned off (set to 0).

When this parameter is turned on (set to 1), orphaned messages are treated the same as regular messages in how the various filters are applied.

[Notes] AppointmentForms=<Alternate Name>

Type:	Default:	New in:
string	[none]	3.1.0

Permits the designation of alternate names for appointment forms to migrate. For example:

```
AppointmentForms=appointment
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
AppointmentForms=appointment|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] ArchiveDesignClass=<DesignClassName>

Type: string	Default: [none]	Expanded in ver 3.2

```
ArchiveDesignClass=class2
```

... tells the program to recognize "class2" as an additional design class (in addition to the default design class) for Archive NSF files. If the program finds an NSF file that does not match any of the program's default design classes for Archive or Mail files, the program will look at this parameter (and the comparable *MailDesignClass* parameter) to find an alternate design class, and thereby determine the file type. To designate more than one additional design class for Archive files, use the pipe character (|) to separate between each pair of class names, like this:

```
ArchiveDesignClass=class2|class3|class4
```

In this *notesdtapp.ini* file , the parameter may also be set to:

```
ArchiveDesignClass=all
```

... to force all NSFs in the specified directory to be displayed in the list, regardless of design class or item count. The "all" option was added in ver 3.2.

[Notes] CountIntentionallySkippedItems=<#>

Type: boolean	Default: 1	New in ver 4.12.1

Determines whether the SSDM's logging and statistics for unmigrated items will include or exclude items that do not appear in the *FailedMessageList* skipped-items folder because they were intentionally skipped. (The *Failed-MessageList* feature is described in separate entries for the *WriteFailedMessageList...* parameters, also in this [Notes] section.)

For example, the program will intentionally skip PAB Replicator messages or calendar items if these items have not been selected for migration, but they will not appear in the *FailedMessageList* skipped-items folder since they were deliberately excluded from the migration. This *CountIntentionallySkippedItems* parameter lets you choose whether MNE should still count these items in its skipped-items statistics, and report them in its logs.

By default (1), the log and statistics will include items that have been skipped but do not appear in the skipped-items folder. To disable logging and counting such items, set *CountIntentionallySkippedItems=0*. Note also:

- Any setting for this *CountIntentionallySkippedItems* parameter is ignored if the *FailedMessageList* feature is disabled.

- A setting of *CountIntentionallySkippedItems=0* will override *[General] LogSkippedAppointment-Responses=1* (so the program will not log or count skipped appointment responses).

[Notes] DateFilterUsingFormula=<#>

Type: boolean	Default: 1

Controls whether the SSDM will use a newer processing method to improve performance when migrating with a date filter, or use the older original method. The program default (1) is to use the newer method, but:

    DateFilterUsingFormula=0

... tells the program to use the original method instead.

[Notes] DocLinksDefaultServer=<ServerName>

Type: string	Default: [null]

Specifies the name of a Domino server that the SSDM will use to compose HTTP- or Notes-style DocLink URLs if it cannot find the server by its own lookup method (as specified by the *DocLinksFastLookupOnly* parameter, described below). The parameter value is a string specifying the name of the server. The specified server name must be the TCP/IP server name (e.g., *bighat.itsfunny.com*), and not a Domino server name (*bighat/itsfunny*).

If the designated lookup method fails to find the server, SSDM will use the server name specified by *DocLinksDefaultServer* or, if no *DocLinksDefaultServer* is specified (default is null), will migrate the item without the DocLink.

[Notes] DocLinksFastLookupOnly=<#>

Type: boolean	Default: 1

Determines the method the SSDM will use to look up the server for an HTTP- or Notes-style DocLink. By default (1), the SSDM will use only a new, faster method introduced in Migrator for Notes to Exchange version 4.5.0. Or you can revert to the earlier method by setting *DocLinksFastLookupOnly=0*. (Quest has not observed any case where the older method was more reliable than the faster new method.)

If neither method finds the server, the SSDM will use the server name specified by the *DocLinksDefaultServer* parameter (see above) or, if no *DocLinksDefaultServer* is specified, will migrate the item without the DocLink.

[Notes] DocLinksHttpPort=<#>

Type: integer	Default: 80

Specifies which port to insert into a DocLink URL upon migration of a DocLink. If unspecified, the SSDM will use port 80.

[Notes] DocLinksPreferCNForNotesUrl=<#>

Type:	Default:	New in:
boolean	0	4.15.1

Determines if the Notes links uses a Domino Server CN name instead of a Domino Server NetAddress when `[General] HTMLdoclinks=3,` migrate DocLinks to Exchange as Notes links (the default). When `DocLinksPreferCNForNotesURL` is set to the default value (0), the Domino Server NetAddress is used.

For example, if the Domino server is configured as follows:
Domino Server CN name = MNE-AUTO-D901
Domino Server NetAddress = MNE-AUTO-D901.prod.quest.corp

- If `[General] HTMLdoclinks=3` and `[Notes] DocLinkPreferCNForNotesUrl=0`, the Migrated DocLink = notes://MNE-AUTO-D901.prod.quest.corp/db/view/document

- If `[General] HTMLdoclinks=3` and `[Notes] DocLinkPreferCNForNotesUrl=1`, the Migrated DocLink = notes://MNE-AUTO-D901/db/view/document

[Notes] ElevateCalendarAuthorACLtoEditor=<#>

Type:	Default:	New in:
boolean	0	4.7

Determines (in conjunction with the parameter *[Notes] MapDefaultAclToReviewer*) how the wizard maps some Notes access levels to Exchange, for calendar and to-do items. Specifically, the *No Access* and the *Depositor* access levels are mapped as shown in the following table, for selected *Read Public* and *Write Public* Notes permissions.

Read Public	Write Public	Migrator for Notes to Exchange **Parameter Settings** (defaults are shown here in red)	Exchange Calendar / ToDo Access Rights
No		[— — — — — — — any combination — — — — — — —]	No Access
Yes	No	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=1	Reviewer
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0 or 1	Reviewer
	Yes	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 or 1 ElevateCalendarAuthorACLtoEditor=1	Editor
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0	Author

[Notes] EncryptedMailOnly=<#>

Type: boolean	Default: 0	New in ver 3.2.0

Determines whether the program will migrate both encrypted and non-encrypted mail (0), or migrate encrypted mail only (1). For example, *EncryptedMailOnly=1* tells the program to migrate only encrypted mail. This feature is also an option in the Data Migration Wizard (same parameter name in the same section, but in the Global Defaults and Task Parameters).

[Notes] FixRtfExtraQuestionMark=<#>

Type: boolean	Default: 0 (off)	New in ver 4.11

Determines whether the SSDM will (1) or will not (0) use an alternate processing method to improve handling of certain foreign characters when migrating from Notes 7. The feature offers improved fidelity when migrating from some Notes 7 sources, but should be left disabled (default) unless you are experiencing garbled text with extraneous question marks in migrated Notes 7 messages containing foreign characters.

[Notes] ForceOldNxRTFdll=<#>

Type: boolean	Default: 0	

Determines whether the SSDM should use a pre-Notes 7 version of the *nxrtf2.dll* file, which the program uses to convert Notes rich text to MS RTF. The *nxrtf2.dll* file that accompanies Notes 7 and later provides better RTF fidelity during data extraction, but appears to be incompatible with some environments where it can cause the Notes environment to crash. This parameter lets you force the SSDM to use the older version of *nxrtf2.dll*:

    [Notes]
    ForceOldNxRTFdll=1

The feature is off (*ForceOldNxRTFdll=0*) by default, but is enabled by setting the parameter value to 1, as in the example above.

[Notes] IgnoreACLs=<ACL_Member>

Type: string	Default: [none]	New in ver 4.1

The program seeks to validate ACL entries by matching each with a corresponding ACL entry in Exchange. Use this parameter to specify one or more ACL member entries that should be ignored.

This parameter can be used to perform the following tasks.

- For a user that is valid on both Notes and Exchange, prevent permissions from being granted for that user in Exchange. Specifying the user in the `IgnoreACLs` parameter suppresses the migration of permissions.

- For a user that is only valid on Notes, prevent multiple Warning messages in the migration log file.

  The wizard creates a Warning in its log file if no corresponding Exchange entry is found. If a particular ACL member entry triggers the Warning, and if the same entry occurs in many of the source ACLs, the Warnings proliferate and swell the log file, making it difficult to read and navigate. Specifying the user in the `IgnoreACLs` parameter suppresses the Warnings.

To set the parameter, specify the ACL member. For example:

    IgnoreACLs=Administrator

... tells the wizard to ignore ACL member entries of *Administrator*. You can specify two or more values by separating them with commas. There is no default value for this parameter, but the Setup program automatically enters the following values upon installation:

    IgnoreACLs=LocalDomainServers,OtherDomainServers

[Notes] IgnoreForms=<FormName>

Type: string	Default: H_PAGEUI	New in ver 4.1.5

Specifies one or more particular forms that should be ignored (not migrated). For example:

> IgnoreForms=H_PAGEUI

... tells the program to not migrate H_PAGEUI forms.

This parameter can also be used to force the program to ignore forms that are ordinarily processed, by preceding the form name with an exclamation point (i.e., *IgnoreForms=!FormName*).

[Notes] JournalEntryForms=<Alternate Name>

Type:	Default:	New in:
keyword	Activity	4.1.5

Permits the designation of alternate names for journal entry forms to migrate. For example:

> `JournalEntryForms=journal`

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

> `JournalEntryForms=journal|another name|...`

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] MapDefaultAclToReviewer=<#>

Type:	Default:	New in:
boolean	1	4.5.4

Determines (in conjunction with the parameter *[Notes] ElevateCalendarAuthorACLtoEditor*) how the wizard maps some Notes access levels to Exchange, for calendar and to-do items. Specifically, the *No Access* and the *Depositor* access levels are mapped as shown in the following table, for selected *Read Public* and *Write Public* Notes permissions.

Read Public	Write Public	Migrator for Notes to Exchange **Parameter Settings** (defaults are shown here in red)	Exchange **Calendar / ToDo Access Rights**
No	[— — — — — — — any combination — — — — — — —]		No Access

		MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
Yes	No	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=1	Reviewer
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0 or 1	Reviewer
	Yes	MapDefaultAclToReviewer=0 ElevateCalendarAuthorACLtoEditor=0	No Access
		MapDefaultAclToReviewer=0 or 1 ElevateCalendarAuthorACLtoEditor=1	Editor
		MapDefaultAclToReviewer=1 ElevateCalendarAuthorACLtoEditor=0	Author

[Notes] MailDesignClass=<DesignClassName>

Type: string	Default: [none]	Expanded in ver 3.2

> MailDesignClass=class2

... tells the program to recognize "class2" as an additional design class (in addition to the default design class) for Mail NSF files. If the program finds an NSF file that does not match any of the program's default design classes for Archive or Mail files, the program will look at this parameter (and the comparable *ArchiveDesignClass* parameter) to find an alternate design class, and thereby determine the file type. To designate more than one additional design class for Mail files, use the pipe character (|) to separate between each pair of class names, like this:

> MailDesignClass=class2|class3|class4

In this *notesdtapp.ini* file, the parameter may also be set to *MailDesignClass=all* to force all NSFs in the specified directory to be displayed in the list, regardless of design class or item count. The "all" option was added in ver 3.2.

[Notes] MapPrivateAsPublic=<#>

Type: boolean	Default: 0

Determines whether the program will mark as "Public" a non-mail message whose Notes *$PublicAccess* attribute is not set. For example:

> MapPrivateAsPublic=1

... tells the program to mark a non-mail-type message as "Public" if its *$PublicAccess* attribute is not set. By default (*MapPrivateAsPublic=0*), the program will leave such messages marked as "Private."

[Notes] MemoForms=<Alternate Name>

Type:	Default:	New in:
string	[none]	3.1.0

Permits the designation of alternate names for mail forms to migrate. For example:

```
MemoForms=memo
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
MemoForms=memo|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] MigrateAppointmentResponses=<#>

Type: boolean	Default: 0	New in ver 4.1.5

Determines whether the SSDM will migrate responses to appointment/meeting requests (Accepted, Declined, etc.). For example: *MigrateAppointmentResponses=1* tells the SSDM to migrate responses.

[Notes] MigrateConflictDocs=<#>

Type: boolean	Default: 0	New in ver 3.1.0

Tells the program whether to migrate replication conflicts. By default (*MigrateConflictDocs=0*), conflict documents will not be migrated. But: *MigrateConflictDocs=1* tells the program to migrate conflict documents to the All Documents folder.

[Notes] MigrateEmptyFolders=<#>

Type: boolean	Default: 1

        MigrateEmptyFolders=0

... tells the program to not migrate empty folders. By default, the program will migrate all folders regardless of whether they contain any items.

[Notes] MigrateOrphanedDocs=<#>

Type: boolean	Default: 1

Tells the program whether to migrate "orphaned" documents that appear only in the Notes *All Documents* folder. Such orphaned documents are migrated by default, to an *All Documents* folder in Exchange, but:

        MigrateOrphanedDocs=0

... tells the program to not migrate those items.

[Notes] MigrateReservationsAlways=<#>

Type: boolean	Default: 1

Determines whether the program will migrate calendar resources. For example, to tell the SSDM to not migrate resources: *MigrateReservationsAlways=0*

> ! **CAUTION:** This parameter should be enabled only when migrating resource reservations. Other uses may cause calendar items to be incorrectly migrated to mailboxes instead of to Outlook calendars.

If not all objects in the collection are classified as resources, but *MigrateReservationsAlways=1*, the SSDM presents a popup warning explaining that the calendars of non-resource objects may not migrate correctly and suggesting that *MigrateReservationsAlways* be disabled (set to 0) unless the user is certain that all objects in the collection are resources. (The popup offers the option of ignoring a *MigrateReservationsAlways=1* setting.)

[Notes] MimeIgnoreBoundryWhitespace=<#>

Type: boolean	Default: 0	New in ver 4.1.9

Determines whether the program will be configured to not ignore MIME data that is preceded by a boundary of whitespace and/or null characters. Example:

        MimeIgnoreBoundryWhitespace=1

... tells the program to not ignore MIME data that is preceded by a boundary of whitespace and/or null characters. The feature is off (0) by default.

[Notes] NotesIniPath=<PathAndFilename>

Type: string	Default: [inferred from operating environment]

Specifies the location of the notes.ini file. This value is inferred from the operating environment and automatically written to the *notesdtapp.ini* file; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] NoticeForms=<Alternate Name>

Type:	Default:	New in:
string	[none]	3.1.0

Permits the designation of alternate names for appointment notice forms to migrate. For example:

```
NoticeForms=notice
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
NoticeForms=notice|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] OrphanedDocsFolder=<Folder Name>

Type: string	Default: [none]	New in ver 3.0.0

Sets the name of the *All Documents* folder in Exchange, which receives orphaned documents from Notes' *All Documents* folder. The folder is named *All Documents* by default, but you can assign any other valid name. For example: *OrphanedDocsFolder=Orphans*

[Notes] PABDesignClass=<DesignClassName>/

Type: string	Default: [none]

PABDesignClass=class2 tells the program to recognize "class2" as an additional design class (in addition to the default design class) for PAB NSF files. If the program finds an NSF file that does not match any of the program's default design classes for Archive, Mail or PAB files, the program will look at this parameter (and the comparable *ArchiveDesignClass* and *MailDesignClass* parameters) to find an alternate design class, and thereby determine the file type. To designate more than one additional design class for PAB files, use the pipe character (|) to separate between each pair of class names, like this: *PABDesignClass=class2|class3|class4*

[Notes] PabGroupForms=<form type>

Type: string	Default: [none]	New in ver 3.1.0

Tells the program whether and how to migrate personal address book (PAB) form types that are not of the standard "Group" form type. For example, to migrate PAB Group form type "Business Card," you would enter:

```
PabGroupForms=Business Card
```

By default (if this parameter is omitted) the program will not migrate PAB form types that are not of the standard form type.

[Notes] PabPersonForms=<form type>

Type: string	Default: [none]	New in ver 3.1.0

Tells the program whether and how to migrate personal address book (PAB) form types that are not of the standard "Person" form type. For example, to migrate PAB Person form type "Business Card," you would enter:

        PabPersonForms=Business Card

By default (if this parameter is omitted) the program will not migrate PAB form types that are not of the standard form type.

[Notes] PABRequiredAttrs=<Attrib1>|<Attrib2>|<Attrib3>|...

Type: string	Default: [none]	New in ver 3.2.0

Defines a list of address-book attributes, from which at least one must be present within a PAB for the PAB to be migrated. The *<Attrib#>* variables stand for the names of address-book attributes in the Notes/Domino source. Each pair of attribute names must be separated by a pipe character (|). For example:

        PABRequiredAttrs=ListName|LastName|CompanyName

... tells the program to migrate a PAB only if it contains at least one of the attributes *ListName* or *LastName* or *CompanyName*. This feature is also an option in the Data Migration Wizard (same parameter name in the same section, but in the Global Defaults and Task Parameters).

[Notes] Password=<AlphanumString>

Type: string	Default: [GUI entry]

This value corresponds to a GUI element in the SSDM: the **Password** text box in the *Specify Notes Login Information* screen. The program writes this value to the Task Parameters based on an admin's GUI entry. The parameter value here is obfuscated, as a security precaution, and Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] QuoteNonAsciiCharsInRTF=<#>

Type: boolean	Default: 1	New in ver 4.0.0

Determines whether the program will quote non-ASCII characters in Notes rich text to preserve them during conversion to Microsoft RTF by versions of *nxrtf.dll* older than 5.0.11. Pre-5.0.11 versions of *nxrtf.dll* convert non-ASCII characters to question marks, so this feature corrects that limitation to permit the migration of non-ASCII characters—for example, Chinese or Thai characters. This feature is on (1) by default, but can be disabled by: *QuoteNonAsciiCharsInRTF=0*. The parameter is ignored if the prevailing version of *nxrtf.dll* is 5.0.11 or higher. See also the *UseAppNxrtfDLL* parameter (also in this [Notes] section) for related information.

[Notes] RecipientBccWords

Type:	Default:	New in:
string	bcc|Blindkopie	4.16.1

This parameter takes effect only if the parameter for migrating RTF to HTML ([Exchange] MigrateRtfToHtml) is enabled . There is an issue in the Notes built-in HTML APIs used by MNE to convert Notes RTF to HTML. The header information such as To, cc, bcc is constructed as a table and is incorrectly inserted to the message body after migration. Use this parameter associated with [Notes] RecipientCcWords and [Notes] RecipientToWords so that MNE will search for the table and remove it from the migrated HTML.

The default value supports English, French, German and Japanese.

[Notes] RecipientCcWords

Type:	Default:	New in:
string	cc|Kopie	4.16.1

This parameter takes effect only if the parameter for migrating RTF to HTML ([Exchange] MigrateRtfToHtml) is enabled. There is an issue in the Notes built-in HTML APIs used by MNE to convert Notes RTF to HTML. The header information such as To, cc, bcc is constructed as a table and is incorrectly inserted into the message body after migration. Use this parameter associated with [Notes] RecipientBccWords and [Notes] RecipientToWords so that MNE will search for the table and remove it from the migrated HTML.

The default value supports English, French, German and Japanese.

[Notes] RecipientToWords

Type:	Default:	New in:
string	to|An|A| 宛先	4.16.1

This parameter takes effect only if the parameter for migrating RTF to HTML ([Exchange] MigrateRtfToHtml) is enabled. There is an issue in the Notes built-in HTML APIs used by MNE to convert Notes RTF to HTML. The header information such as To, cc, bcc is constructed as a table and is incorrectly inserted into the message body after migration. Use this parameter associated with [Notes] RecipientBccWords and [Notes] RecipienCcWords so that MNE will search for the table and remove it from the migrated HTML.

The default value supports English, French, German and Japanese.

[Notes] ReservationForms=<Alternate Name>

Type:	Default:	New in:
string	[none]	3.1.0

Permits the designation of alternate names for appointment or resource reservation forms to migrate. For example:

```
ReservationForms=reservation
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
ReservationForms=reservation|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] RewriteDocLinks=<#>

Type:	Default:	New in:
boolean	1	3.2

When set to the default value (1), MNE scans Notes files for document links in the RTF message body and rewrites the links as HTML-style links. To disable the parameter, set the value to 0.

Setting the parameter to 0 is equivalent to setting:

- `[General]HTMLDocLinks=0`

- `[Exchange]ExtractEmbeddedImage=0`

[Notes] Server=<ServerSpecification>

Type: string	Default: [GUI entry]

This value corresponds to a GUI element in the Notes Migration Manager: the **Server** text box in the *Notes Server Configuration* screen. The program writes this value to *notesdtapp.ini* from the GUI entry in NMM; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] SkipCompletedTasks=<#>

Type: boolean	Default: 0	New in ver 4.5

Determines whether the SSDM will skip or migrate tasks that are complete in the Notes source. For example:

> SkipCompletedTasks=1

… tells the SSDM to skip (not migrate) Notes tasks that are marked as complete. The feature is off (*SkipCompletedTasks=0*) by default.

[Notes] SkipInternetHeaders=<#>

Type:	Default:	New in:
boolean	0	4.13.0.78

Determines if message internet headers are migrated. By default, message internet headers are not skipped. When internet headers are migrated, all internet header information and the header is migrated.

If SkipInternetHeaders is set to On (1), none of the message internet headers are migrated.

[Notes] SkipNotes=<MsgIDHexString>

Type: string	Default: [none]	New in ver 4.1

Specifies one or more messages that the SSDM should skip when migrating data, typically used to bypass the rare message that contains some problematic element, such as corrupted data, that the program cannot process. When a program run is abandoned by a "bad" message, the run log reports the message ID (an arbitrary hex string generated by the program) near the end of the log, for example: *notesID 0X00001FFA*. An admin can exclude that message by this parameter setting:

> SkipNotes=0X00001FFA

... so the program will ignore that message the next time it runs. In the event a single program run should encounter two or more problematic messages, you can use this parameter to specify multiple message IDs separated by commas.

[Notes] StandardAndUserFoldersOnly=<#>

Type:	Default:	New in:
boolean	1	4.15

When this option is enabled, folders and views whose names are surrounded by brackets are flagged as system objects. System views and folders (with the exception of a specific set of standard system views and folders) will not be migrated. With this option enabled, a typical migration will include the following views and folders:

- ($Inbox)

- ($Sent)

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

196

- ($Drafts)

- ($Trash)

- ($JunkMail)

- (Stationery)

- All user views and folders (identified as views and folders whose names are NOT surrounded by brackets)

- ($All) (only when orphaned messages are migrated as per the `[Notes] MigrateOrphanedDocs` setting)

- Any other views and folders listed in the [IncludeFoldersAndViews] section

Setting `StandardAndUserFoldersOnly` to 0 allows both system and user folders/views to be migrated. Note that this requires configuring the [Filters] section with the itemized list of folders and views that should not be included in the migration.

[Notes] StationeryFolder=<FolderName>

Type: string	Default: [none]

Specifies the name of the Notes folder that contains Notes stationery. Example:

> StationeryFolder=Letterhead

Usually the program can automatically determine the source location of Notes stationery, but in some cases the folder must be explicitly specified by this parameter.

[Notes] StationeryForms=<FullPathAndFilename>

Type: string	Default: [none]

Specifies one or more custom-designed Notes stationery forms to migrate. The parameter value consists of a form filename, which may end with an asterisk (*) for simple wildcard matching. You may specify multiple filenames by using a pipe character (|) to separate each pair. For example:
StationeryForms=filename1 | filename2 | filename3

[Notes] TaskForms=<Alternate Name>

Type:	Default:	New in:
string	[none]	3.1.0

Permits the designation of alternate names for task forms to migrate. For example:

> TaskForms=task

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

> TaskForms=task|another name|...

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] TaskNoticeForms=<Alternate Name>

Type:	Default:		New in:
string	[none]		3.1.0

Permits the designation of alternate names for task notice forms to migrate. For example:

```
TaskNoticeForms=tasknotice
```

You may enter a value ending with an asterisk (*) for simple wildcard matching. You may also specify one or more form names; the first listed name is the default. To define more than one, use a pipe character (|) to separate each pair:

```
TaskNoticeForms=tasknotice|another name|...
```

Forms are used to classify message type. The precedence order is:
JournalEntryForms > MemoForms > AppointmentForms | NoticeForms | TaskForms | TaskNoticeForms | ReservationForms

For example, if a message matches with both MemoForms and AppointmentForms, it is classified as mail, not as an appointment.

[Notes] UpdateRtfFonts=<#>

Type: boolean	Default: 1	New in ver 4.1.4

Determines whether the SSDM will (1) or will not (0) automatically replace the Microsoft generic serif, sans-serif and Courier fonts in RTF message bodies with, respectively, Times New Roman, Arial and Courier New fonts. For example: *UpdateRtfFonts=0* tells the wizard to not make those replacements. The option is on (1) by default.

[Notes] UseAppNxrtfDLL=<#>

Type: boolean	Default: 1	New in ver 4.0.0

Determines whether the program will try to use a more recent compatible version of *nxrtf.dll* (if available) to convert Notes rich text to MS RTF. Pre-5.0.11 versions of nxrtf.dll convert non-ASCII characters to question marks, so this feature permits the migration of non-ASCII characters—for example, Chinese or Thai characters—by telling the program to use a later version of *nxrtf.dll*. This feature is on (1) by default, but can be disabled by *UseAppNxrtfDLL=0*

The alternate (more recent) version of *nxrtf.dll* must reside in the same directory as the SSDM program file, and its major version must be the same as the major version of nnotes.dll. You may find a 5.0.11 version of *nxrtf.dll* in the Notes program directory of a known 5.0.11 client installation.

If the program finds no newer version of *nxrtf.dll* that meets the conditions noted above, it will use the *nxrtf.dll* found in the PATH. If no 5.0.11 or later version of *nxrtf.dll* is available, see *QuoteNonAsciiCharsInRTF* (also in this [Notes] section) for an alternate solution to the non-ASCII characters conversion problem.

[Notes] UseIMAPFlags=<#>

Type: boolean	Default: 0

UseIMAPFlags=1 tells the program to check bit 0 of the *$FolderRefFlags* Notes attribute to determine whether messages are read or unread. The bit is set to 0 if an item is unread, or set to 1 if the item has been read.

Quest Migrator for Notes to Exchange 4.16.3 Program Parameters Reference Guide
Parameters for the Self-Service Desktop Migrator (SSDM)

198

[Notes] UseLegacyMeetingParentHeuristic=<#>

Type:	Default:		New In:
boolean	1		4.12

Specifies the method to be used to process a complex recurring meeting series where the series parent is difficult to identify. For example:

```
UseLegacyMeetingParentHeuristic=0
```

... tells the wizard to apply an alternate method that is better suited to such complex series. By default (1) MNE uses the previous method, which is better suited to environments migrating no (or few) such series.

[Notes] UseMailFileOnly=<#>

Type: boolean	Default: 0

Determines whether the **Specify directory where Notes mail files are located** GUI element will appear on the *Select Notes Local Mail File Replica to Migrate* screen. For example: *UseMailFileOnly=1* tells the program to display the **Specify directory...** text box, and its associated label and **Browse** button. By default (*UseMailFileOnly=0*), these GUI elements will not appear in the screen.

[Notes] UserFolderPrefix=<FolderName>

Type: string	Default: Folders	New in ver 4.1

Specifies the name of an Outlook folder to which all user-created Notes folders will be migrated (as subfolders). For example: *UserFolderPrefix=MyFolders* tells the program to create a folder named *MyFolders* in the Outlook root directory (at the same level as the Inbox), and copy all user-created Notes folders to the new *MyFolders* folder in Outlook. The default value is *Folders.* See also Custom folder mapping on page 13 for more information about this *UserFolderPrefix* parameter, and how its value affects custom-folder mapping parameters in the language sections of Migrator for Notes to Exchange parameters.

> **i** | **NOTE:** Setting the value to an empty string results in the custom folders being created at the same level as the Inbox folder.

[Notes] UserIdFile=<AlphanumString>

Type: string	Default: [null]

This value corresponds to a GUI element in the Notes Migration Manager: the **User ID file** text box in the *Notes Server Configuration* screen. The program writes this value to *notesdtapp.ini* from the GUI entry in NMM; Quest recommends you do not manually enter or change this value except at the direction of Quest Support.

[Notes] UserViewPrefix=<FolderName>

Type:	Default:		New in:
string	Views		4.15

Specifies the name of an Outlook folder where all user-created Notes views are migrated to (as subfolders).

For example: `UserViewPrefix=MyViews` tells the program to create a folder named `MyViews` in the Outlook root directory (at the same level as the Inbox), and copy all user-created Notes views to the new `MyViews` folder in Outlook. The default value is `Views`.

> **i** | **NOTE:** Views do not exist in Exchange. A Notes view is migrated to Exchange as a folder.

> **i** | **NOTE:** Setting the value to an empty string results in the custom folders being created at the same level as the Inbox folder.

[Notes] ViewAndFolderFlagPattern=<string>

Type:	Default:		New in
string	-G40^n		4.15

The `ViewAndFolderFlagPattern` value is used to identify those Notes design elements of the VIEW class that should be classified as Views or Folders. Only the design elements whose design flags match the specified pattern are migrated. All other design elements will be ignored. This prevents the migration of design elements that belong to the VIEW class, but are not in fact views or folders. For example this pattern prevents the migration of shared columns.

The specified pattern must follow the syntax specified by the Notes API under Design Flag Patterns. The specific flags and their meanings can be obtained from the Notes API in the file `stdnames.h`. This header file also includes a list of patterns for identifying specific types of design elements. The default pattern used above comes from the pattern `DFLAGPAT_VIEWS_AND_FOLDERS` in `stdnames.h`.

This parameter is considered an extremely advanced setting, and should only be modified at the direction of Quest Support.

[Notes] WriteFailedMessageListToThisMbxFolder=<string>
[Notes] WriteFailedMessageListClass=<keyword(s)>

Types: string and keyword(s)	Defaults:	New in 4.12.1
	WriteFailedMessageListToThisMbxFolder=*[null]* WriteFailedMessageListClass=Errored	

This pair of parameters together let you configure the SSDM to generate a folder of messages and calendar items that are not migrated to the target. These items will be referenced as doclinks in a new folder in the user's Notes mailbox. The feature is enabled/disabled and configured by:

```
[Notes]
WriteFailedMessageListToThisMbxFolder=<string>
WriteFailedMessageListClass=<keyword(s)>
```

The *WriteFailedMessageListToThisMbxFolder* parameter specifies a name for the folder to be added to the user's mailbox, to contain the unmigrated items. *WriteFailedMessageListClass* specifies one or more types of unmigrated items for the feature to capture; valid keyword values are: *Errored*, *Skipped* and *Filtered*. To specify more than one type, separate multiple keywords by the pipe ("|") character, as in this example:

```
WriteFailedMessageListToThisMbxFolder=Unmigrated
WriteFailedMessageListClass=Errored|Skipped|Filtered
```

This example tells the SSDM to create copies of any *Errored*, *Skipped* and/or *Filtered* items and save them in a new folder named *Unmigrated* in the user's mailbox.

The feature is enabled by entering any value for the *WriteFailedMessageListToThisMbxFolder* parameter. (If that parameter is omitted or its value is left empty, the feature is disabled and the *WriteFailedMessageListClass* parameter is ignored.) The feature is disabled by default (*WriteFailedMessageListToThisMbxFolder* is omitted or its value is [null]), and by default *WriteFailedMessageListClass=Errored* (only).

[PAB] section

[PAB] MakeDefault=<#>

Type: boolean	Default: 1

Determines whether a migated PAB will be designated as the user's default PAB, if no default PAB is already designated for that user in Exchange. For example: *MakeDefault=0* tells the program to not set the migrated PAB as the user's default.

[PAB] ShowFirst=<#>

Type: boolean	Default: 1

Determines whether the destination directory of a migated PAB will be designated as the user's default PAB directory, if no default PAB directory is already designated for that user in Exchange. For example: *ShowFirst=0* tells the program to not set the migrated PAB directory as the user's default.

[Screens] section

For all parameters in this [Screens] section ...

These are all "multiple-choice" parameters. For any of the parameters in this [Screens] section, the three valid values are:

- *show:* The screen appears in every run.
- *skip:* The screen appears only if the information it ordinarily obtains from the user cannot be otherwise obtained or inferred.
- *silent:* The screen never appears in any run.

Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how these parameters relate to others to customize the SSDM.

[Screens] Filter=<ValidKeyword>

Type: keyword	Default: no-op

Determines whether, or under what circumstances, the *Select Date and Size Filters* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *Filter=show*

The default value "no-op" is a fourth valid value (for this *Filter* parameter only). The "no-op" setting is functionally equivalent to "silent," but signifies that the parameter value is unassigned—in which case the screen will not appear in a program run.

[Screens] Finished=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Migration Report* screen (the "*Finished*" screen) will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *Finished=skip*

[Screens] Login=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Specify Notes Login Information* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *Login=skip*

[Screens] MigrateWhat=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Specify Data for Migration* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *MigrateWhat=skip*

[Screens] Profile=<ValidKeyword>

Type: keyword	Default: skip

Determines whether, or under what circumstances, the *Select Profile* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *Profile=show*

[Screens] Progress=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Migrating Data* screen (the "*Progress*" screen) will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. Since this screen does not collect any information, the *skip* and *silent* options are equivalent. For example: *Progress=skip*

[Screens] PstDir=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Specify Directory for Migrated Archive* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *PstDir=skip*

[Screens] SelectAddrBook=<ValidKeyword>

Type: keyword	Default: skip

Determines whether, or under what circumstances, the *Select Notes Address Books to Migrate* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *SelectAddrBook=show*

[Screens] SelectArchive=<ValidKeyword>

Type: keyword	Default: skip

Determines whether, or under what circumstances, the *Select Notes Archive Files to Migrate* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *SelectArchive=show*

[Screens] SelectMailFile=<ValidKeyword>

Type: keyword	Default: skip

Determines whether, or under what circumstances, the *Select Notes Local Mail File Replica to Migrate* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. For example: *SelectMailFile=show*

[Screens] Summary=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Selection Summary* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. Since this screen does not collect any information, the *skip* and *silent* options are equivalent. For example: *Summary=skip*

[Screens] Welcome=<ValidKeyword>

Type: keyword	Default: show

Determines whether, or under what circumstances, the *Welcome* screen will appear in program runs. See **For all parameters...** at the beginning of this [Screens] section for valid parameter values. Since this screen does not collect any information, the *skip* and *silent* options are equivalent. For example: *Welcome=skip*

[ServerData] section

[ServerData] MigrateCalData=<#>

Type: boolean	Default: 1

Determines whether the program will migrate server calendar data. For example: *MigrateCalData=0* tells the program to not migrate server calendar data. By default (*MigrateCalData=1*), the program will migrate server calendar data.

[ServerData] MigrateEncryptedMessages=<#>

Type: boolean	Default: 1	New in ver 3.2

Determines whether the SSDM should attempt to migrate the encrypted portions of encrypted messages in the source server mail. This feature can also be applied to encrypted messages in the source archives, by this same parameter name in the [ArchiveData] section of *notesdtapp.ini*. The feature is also available for the Data Migration Wizard (same parameters in the same sections, but in Migrator for Notes to Exchange's Global Defaults and Task Parameters), but in the wizard the default is 0.

The SSDM can migrate the encrypted portion of an encrypted message if it has the access credentials of the user who is authorized to decrypt the encrypted portion. This is the typical case for most organizations who use the SSDM, where individual users run the SSDM under their own login credentials, to migrate their own data. But in the rare case where the access credentials for a user's encrypted data are different from the credentials of whoever is running the program, this parameter lets you control how the SSDM should handle encrypted data. If the program attempts to migrate an encrypted message but lacks the necessary credentials, it can migrate the unencrypted portions, skip the encrypted portions, and insert text notices to explain that the encrypted portions could not be migrated.

On the other hand: *MigrateEncryptedMessages=0* tells the SSDM to not even attempt migrating the encrypted portions, but to just migrate the unencrypted portions and insert the notice text. If *MigrateEncryptedMessages=1*, the program will attempt to migrate the encrypted portions, and will succeed or fail depending on whether the account running the SSDM has the necessary credentials. If it fails, the SSDM will migrate the message, skip the unencrypted portion and insert the notice—the same outcome as for *MigrateEncryptedMessages=0*.

A related Migrator for Notes to Exchange parameter lets you tell the SSDM to skip an entire message (both encrypted and unencrypted portions) if the program is already configured to skip the encrypted portion (only) by *MigrateEncryptedMessages=0*. See *SkipEntireEncryptedMessage* in this same [ServerData] section for more information.

[ServerData] MigrateMailData=<#>

Type: boolean	Default: [GUI entry]

This value corresponds to a GUI element in the SSDM: the **Migrate local mail file replica** check box of the *Specify Data for Migration* screen. The SSDM writes this value to *notesdtapp.ini* from a user's GUI entry; Quest recommends you do not manually enter or change this value except at the explicit direction of Quest Support staff.

[ServerData] MigrateTaskData=<#>

Type: boolean	Default: 1	New in ver 4.2.1

Determines whether the program will migrate server task data. For example: *MigrateTaskData=0* tells the program to not migrate server tasks. By default (*MigrateTaskData=1*), the program will migrate server tasks.

[ServerData] MigrateTrashFolder=<#>

Type: boolean	Default: 0

        MigrateTrashFolder=1

... tells the program to migrate the server trash folder if the *Specify Data for Migration* screen does not appear, or sets the associated check box in that screen to be marked by default. A value of 0 tells the program to not migrate the server trash folder, or sets the associated check box to be unmarked by default. The most common use of this parameter is to provide the necessary entry value when the program is configured to hide the *Specify Data* screen. Chapter 4 of the Migrator for Notes to Exchange *Scenarios Guide* explains how this parameter relates to others used to customize the SSDM.

[ServerData] MigrateViews=<#>

Type: keyword	Default: 0 (but the SSDM initializes the value to 1)

Determines whether and how the SSDM will migrate archive items that occur within Notes views. For example: *MigrateViews=1* tells the program to migrate items only from the first view in which they are found. Valid parameter values are:

- 0 (default): No views are migrated.

- 1: Items are migrated only from the first view in which they are found.

- 2: Items are migrated from all views in which they are found.

Note that the program will initialize this parameter to 1 if it is omitted from *notesdtapp.ini*, even though technically the program default is 0. You must explicitly include the parameter in *notesdtapp.ini* if you want the SSDM to run with *MigrateViews=0* or *MigrateViews=2*.

[ServerData] OOF=<#>

Type: boolean	Default: 0

Determines whether the program will migrate out-of-office messages. For example: *OOF=1* tells the program to migrate out-of-office messages. By default (*OOF=0*), the program will not migrate out-of-office messages

> **i** | **NOTE:** Migration of out-of-office messages *(OOF=1)* is not supported if the migration target is set to **Personal folder (.pst)**.

[ServerData] SkipEntireEncryptedMessage=<#>

Type: boolean	Default: 0	New in ver 4.6

Determines whether the SSDM will skip entire encrypted messages (skip both encrypted and unencrypted portions) in the source server data if the SSDM is already configured to skip the encrypted portions by *MigrateEncryptedMessages=0* (also in this [ServerData] section).

> SkipEntireEncryptedMessage=1

… tells the program to skip any encrypted messages in their entirety if *MigrateEncryptedMessages=0*. This *SkipEntireEncryptedMessage* parameter is irrelevant and ignored if *MigrateEncryptedMessages=1*.

For more information about how encrypted messages are migrated, and how this *SkipEntireEncryptedMessage* parameter helps control how the SSDM processes encrypted messages, see the parameter notes for *MigrateEncryptedMessages* earlier in this [ServerData] section.

[SSDMThrottle] section

[SSDMThrottle] UseThrottle=<#>

Type: boolean	Default: 0	New in ver 4.1.5

Determines whether the SSDM will use any of the throttling features, whereby an admin can regulate end users' use of the SSDM to avoid processing bottlenecks that might otherwise occur if too many users try to use the SSDM simultaneously. For example:

> UseThrottle=1

… tells the SSDM program to use the throttling features, as configured by an administrator in the SSDM Throttling Utility. (The SSDM Throttling Utility is fully documented in the Migrator for Notes to Exchange *Administration Guide*.) By default these features are disabled (*UseThrottle=0*).

If *UseThrottle=1*, a value must also be specified for the *WebServiceUrl* parameter, also in this [SSDMThrottle] section.

[SSDMThrottle] WebServiceUrl=<UrlToWebsite>

Type: string	Default: [none]	New in ver 4.1.5

Specifies the URL to the web service for the SSDM throttling features, as configured by an administrator in the SSDM Throttling Utility. (The SSDM Throttling Utility is fully documented in the Migrator for Notes to Exchange *Administration Guide*.) For example:

> WebServiceUrl=http://xyzcorp.com/ssdmschedulingwebservice/SSDMSchedulingWebService.asmx

A value for the *WebServiceUrl* parameter becomes mandatory if *UseThrottle=1* (also in this [SSDMThrottle] section).

[Status] section

Code=<value>
Info=<value>
Text=<value>

All these are internal scratch parameter (see Transient "scratch" parameters).

[TimeZoneInfo] section

Exchange uses time zone identifiers that correspond with time zones found in the Windows time zone database. Depending on the client application used to create an appointment or meeting, the Notes calendar item being migrated may not contain the specific time zone code that is used by Exchange. For example, if an appointment is created using an application on an Apple device, the time zone code in the appointment will not match any of the known Windows time zones. To help the migration software identify the appropriate Windows time zone, specify a list of preferred Windows time zones in the `[TimeZoneInfo]` section.

To understand how the list of preferred time zones is used, the algorithm that is used to select the appropriate time zone from the Windows time zone database is described below.

1   The time zone information provided in the Notes meeting is compared to the collection of time zones defined in the Windows time zone database. A list of potential matches is generated. If the list of potential matches contains a single time zone, it is selected. If the meeting was created by a Notes client running on a Windows operating system, a unique match here is probable.

2   If a unique match is not found, a list of preferred time zones (configured in the `[TimeZoneInfo]` section) is compared to the list of potential matches. The first successful compatible match from the list of preferred time zones is selected.

3   If no time zone was selected in step 2, the Windows system current local time zone's properties are compared to the time zone information from the Notes meeting. If they are compatible, the local time zone is selected.

4   If the local time zone is not compatible, the first time zone from the list of potential matches is chosen.

5   If none of the time zones defined in the Windows time zone database are found to be potential matches, the local time zone is used.

The `[TimeZoneInfo]` section lists your preferred time zones from the Windows Time Zone database. Each time zone is specified with its unique identifier. You can retrieve a full list of Windows time zone identifiers using the following PowerShell cmdlet:

```
[System.TimeZoneInfo]::GetSystemTimeZones() | Sort-Object DisplayName | ft -
autosize DisplayName, Id
```

The cmdlet returns a table of time zone **DisplayName** and **Id** values.

The **Id** value is used in the `[TimeZoneInfo]` section. The `[TimeZoneInfo]` collection is configured by providing the **Id** values of the preferred time zones. Each value in the `[TimeZoneInfo]` section should be prefixed with the name `TimeZoneN`, where `N` represents a counter starting at 0. Below is a sample configuration of the `[TimeZoneInfo]` section:

```
[TimeZoneInfo]

TimeZone0=Eastern Standard Time

TimeZone1=Central Standard Time

TimeZone2=Mountain Standard Time

TimeZone3=Pacific Standard Time

TimeZone4=Alaskan Standard Time

TimeZone5=Hawaiian Standard Time
```

[TimeZoneNames] section

For most migrations, configuring the `[TimeZoneInfo]` section should be sufficient to determine the correct time zone for scheduled meetings and appointments. However, if two very similar time zones are being used, the migration may have difficulty identifying the correct time zone. Configuring the `[TimeZoneNames]` section can provide additional guidance.

Each Notes meeting and appointment contains a time zone description string similar to the following:

```
StartTimeZone = "Z=5$DO=1$DL=3 2 1 11 1 1$ZX=0$ZN=America/New_York"
```

The `ZN` parameter of the string identifies the name of the time zone. If the appointment was scheduled from a Windows client or browser, the name corresponds to a name in the Windows time zone database and a unique time zone match is assured. If the appointment was scheduled from a mobile device or a non-Windows operating system, the time zone name will not match a Windows time zone and additional steps must be taken.

In the example shown above, scheduled from an Android device, the time zone `America/New_York` corresponds to the Windows time zone identifier `Eastern Standard Time`. You can configure the `[TimeZoneNames]` section to map non-Windows time zone names to their Windows equivalent. For example:

```
[TimeZoneNames]
America/New_York=Eastern Standard Time
```

The value on the right corresponds to the identifier of the Windows time zone. See the `[TimeZoneInfo]` section for details on retrieving the correct time zone identifier.

[Titles] section

"Title" Field Translations

The parameters in this [Titles] section specify Chinese equivalents of English-language courtesy titles . Notes saves the Titles in English, but displays them in the localized language, so the migration program can migrate only the stored English-language titles. These parameters are therefore necessary to convert the migrated English-language titles into the appropriate localized Chinese equivalents in Exchange. For example:

```
[Titles]
Mr.= 先生
Mrs.= 夫人
Miss= 小姐
```

Each parameter tells the program to convert the title listed as the keyword (left of the = sign) to the Chinese string to the right of the = sign. New in ver 3.2.

[User] section

[User] ForceFolderName=<value>

Internal scratch parameter (see Transient "scratch" parameters).

About us

Quest provides software solutions for the rapidly-changing world of enterprise IT. We help simplify the challenges caused by data explosion, cloud expansion, hybrid datacenters, security threats, and regulatory requirements. We are a global provider to 130,000 companies across 100 countries, including 95% of the Fortune 500 and 90% of the Global 1000. Since 1987, we have built a portfolio of solutions that now includes database management, data protection, identity and access management, Microsoft platform management, and unified endpoint management. With Quest, organizations spend less time on IT administration and more time on business innovation. For more information, visit www.quest.com.

Technical support resources

Technical support is available to Quest customers with a valid maintenance contract and customers who have trial versions. You can access the Quest Support Portal at https://support.quest.com.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request.
- View Knowledge Base articles.
- Sign up for product notifications.
- Download software and technical documentation.
- View how-to-videos.
- Engage in community discussions.
- Chat with support engineers online.
- View services to assist you with your product.
